altar-board (ál'tár-bórd), *n.* In the *Coptic Ch.*, a movable wooden panel, carved with a cross in the center and with sacred letters and devices around it. It rests in a recess on the top of the stone altar, and supports the chalice and paten during the mass, a reversal of the Western rite, for which see *altar*, 2, and *altar-slab*. *A. J. Butler, Coptic Churches, II 13-5*

altar-bread (ál'tár-bred), *n.* Bread prepared for the eucharist. Unleavened bread is required for this purpose in the Roman Catholic Church, and is used in many Anglican churches, in which either leavened or unleavened bread is permitted. In both the latter is made into small thin disks or wafers, called *seventally altar breads*, usually stamped with some emblem, as the cross or crucifix, or I H S. In the former church, after consecration, the altar bread is called *host* (see *host*), and the wafers are of two sizes, the larger for the priest, the smaller for the people. The Greek Church uses leavened bread especially made for the purpose. See *oblate*, *n.*, 1.

It is a general term, and includes the close case of linen which was used in the middle ages and removed only for washing the altar, the later cerecloth (which see), and the temporary coverings, whether of white linen, or of rich stuff, or of embroidery. The different coverings for the altar have different names. See *antependium*, *frontal*, and *superfrontal*.

On the continent of Europe they are found in the sacristies of many churches, and are frequently used, carried on either side of the crucifix, at funerals and solemn processions of the blessed sacrament, in those divisions of the church which practise reservation of the holy eucharist. *Lee, Eccles. Terms*.

Sometimes there are two or more steps or ledges. In modern usage often called *retable*, though the *retable* is more properly higher and in itself an important architectural or decorative feature. See *retable*. Also termed, but incorrectly, *super altar*.

As the altar stood free in the choir, and the altar piece was to be seen from behind as well as from before, both sides were to be covered with painting.

altar-table (ál'tár-tá'hl), *n.* 1 In a Christian church, the top or the consecrated portion of an altar, the altar proper, or mensa—2 A name for one of the wooden tables which were substituted for the old altars in England in the seventeenth century, and used for the communion where the old altars had been destroyed by the Roundheads. At first this table was placed by the reformers against the eastern wall in the position of the old stone altar. This position gave umbrage to the Puritans, who held that it was characteristic of the Church of Rome. Cromwell therefore caused the altar table to be removed to the middle of the chancel, and to be surrounded with seats for the communicants. At the restoration it was almost universally replaced in its ancient position. When used it is covered with a white linen cloth.

A term first employed by the French philosopher Comte to denote the benevolent instincts and emotions in general, or action prompted by them, the opposite of *egoism*.

If we define *altruism* as being all action which, in the normal course of things, benefits others instead of being fitted self then, from the dawn of life, *altruism* has been no less essential than *egoism*.

Common or potash alum has the formula $Al_2(SO_4)_3 \cdot 4K_2SO_4 + 24H_2O$. It is produced by mixing concentrated solutions of potassium sulphate and crude aluminium sulphate. The double salt at once crystallizes in octahedrons. Alum is soluble in water, has a sweetish sour taste, reddens litmus, and is a powerful astringent. In medicine it is used internally as an astringent, externally as a styptic applied to severed blood vessels. In the arts it is used as a mordant in dyeing, and extensively in other ways. When mixed in small amount with inferior grades of flour, it is said to whiten them in the process of bread making, but its effect on the system is injurious. *Alum shale*, an other name for *alum slate*, including especially its more siliceous varieties. — *Alum slate*, a variety of clay slate containing more or less carbonaceous material (remains of seaweeds, etc.), with which is associated an easily decomposed and frequently occurring compound of sulphur and iron (marcasite). The decomposition of this substance gives rise to an efflorescence of alum, usually potash alum, which is a compound of potassium sulphate and aluminium sulphate. — *Burnt alum*, alum from which the water of crystallization has been driven off by heat. Also called *dried alum*, *alumen exsiccatum*. — *Concentrated alum*, normal aluminium sulphate, $Al_2(SO_4)_3$, which is prepared on a large scale by treating roasted clay with oil of vitriol, and crystallizing out the sulphate formed. It is largely used in dyeing. Also called *potent alum*. — *Cubic alum*, or *basic alum*, the mineral alum stone. — *Earth of alum*. See *earth*. — *Roman alum*, a variety of potash alum prepared from the mineral alum stone, of special value to dyers, since it contains no soluble iron salts. alumina (a-lū'mi-nā), *n* [*NL, < L. alumen (alumin-)* see *alum*] The oxide of aluminium, Al_2O_3 , the most abundant of the earths. It is widely diffused over the globe in the shape of clay, loam, and other similar substances, corundum, in its varieties adamantine spar, the ruby, and sapphire, is alumina nearly pure and crystallized. In these forms alumina is, next to the diamond, the hardest substance known. Its great value in the arts depends on its affinity for vegetable coloring matters and animal fiber. It forms the base of the lakes in dyeing and acts also as a mordant. United with silica it is extensively used in the manufacture of all kinds of pottery and porcelain ware, crucibles, mortar, and cements.

aluminate (a-lū'mi-nāt), *v. t.*, pret. and pp. *aluminated*, ppr. *aluminating* [*< L. aluminatus*, pp. adj., *< alumen (alumin-)* see *alum*] To treat or impregnate with alum, specifically, in printing engravings, to wash (the paper) with alum-water to prevent the running of the lines.

aluminium (al-ū'mīn'ū-m), *n* [*NL (> F. alumine, > E. alumen), < L. alumen (alumin-)*, alum (see *alum*), + *-um*, as in *sodium*, *potassium*, etc., first proposed by Davy in the form *aluminum* and then *aluminium*. It was discovered by Wöhler.] Chemical symbol Al; atomic weight 27.1. A metal of silver-white color and brilliant luster, about as hard as zinc, very malleable and ductile, highly sonorous, and a good conductor of heat and electricity. Its most remarkable character is its low specific gravity (2.56), which is about one third that of iron and less than that of marble. It does not tarnish in the air, and even in a moist state does not oxidize, its melting point is somewhat lower than that of silver. Aluminium in combination with oxygen (Al_2O_3) forms the common earth alumina, which exists in nature as the mineral corundum, of which the ruby, sapphire, and emery are varieties, the hydrate of sesquioxide exists as the minerals diaspore, gibbsite, and bauxite. Alumina also enters into the composition of a very large number of minerals, the most important of which are the feldspars. From the decomposition of these, clay (kaolin, etc.) is produced, which is essentially a hydrated silicate of aluminium. Among other important minerals containing aluminium are the silicates andalusite, cyanite, fibrolite, topaz, and all of the zeolites, the fluorid of aluminium and sodium cryolite, from which the metal is reduced, the oxide of aluminium and magnesium, spinel, the sulphates aluminic, alum stone, the alums, etc., the phosphates turquoise, lazulite, etc., the carbonate dawsonite, and many others. It is estimated that in its various compounds aluminium forms about one twelfth of the crust of the earth. In consequence of its very low specific gravity, freedom from tarnish, non-poisonous qualities, and ease of working, aluminium is a valuable metal. The use of aluminium has extended with the rapid decrease, through improved processes, in the cost of separating it from the combinations in which it occurs in nature. It is used especially for physical apparatus and other articles in which lightness and great strength are necessary. The cap of the Washington monument, which forms the tip of its lightning rod, is a pyramidal mass of aluminium weighing 100 ounces. Also written *aluminum*. — **Aluminium bronze**, an alloy of 9 parts of copper with 1 of aluminium. It resembles gold in luster and color, and is used as a cheap imitation of that metal. Unlike gold, however, it gradually tarnishes on exposure to the air. It is much used in cheap jewelry and ornamental work, and also for a great variety of industrial purposes, especially for bearings in machinery. — **Aluminium silver**, a

aluminum

compound formed by the addition of a small amount of silver to aluminium. It is said that 8 per cent of silver is sufficient to give to aluminium the color and brilliancy of pure silver, over which it has the great advantage of not being tarnished by sulphured hydrogen. **Aluminum solder**, an alloy of gold, silver, copper, and, for soft solder, a little zinc used in soldering aluminium bronze.

Diplomatic agents are divided into three general classes (1) *ambassadors*, *legates*, and *nuncios* (2) *envoys* and *ministers plenipotentiary* (including *ministers resident*), (3) *chargés d'affaires*. Ambassadors represent the person of their sovereigns, as well as the state from which they come, and are entitled to ask an audience at any time with the chief of the state to which they are accredited to rank next to the blood royal to exemption from local jurisdiction for themselves and their household, to exemption from imposts and duties, immunity of person, free exercise of religious worship, etc. The United States sent and received no ambassadors till 1888, but only ministers of the second rank, who were often popularly called ambassadors. The nuncios of the pope who are not cardinals, and the *legati a latere* and *de latere*, (cardinals in rank represent the papal see in its ecclesiastical capacity mainly, and bear the rank of ambassadors. Envoys, ministers, and ministers plenipotentiary are held to represent not the person of the sovereign, but the state from which they are sent, and they are accredited to the sovereign of the state to which they are sent. This is the ordinary class of diplomatic representatives between less important states, or between greater and smaller states. Ministers resident are accredited to the sovereign enjoy a rank similar to that of envoys. Chargés d'affaires are resident agents of their governments, and are provided with credentials to the ministers of foreign affairs, with which officer at the present day, however both ambassadors and ministers have to deal almost exclusively in their official relations. See *minister*. Hence — 2 In general, any diplomatic agent of high rank, an agent or a representative of another on any mission — 3 A thing sent as expressive of the sentiments of the sender.

2 A mineralized pale-yellow, sometimes reddish or brownish, resin of extinct pine-trees, occurring in beds of lignite and in alluvial soils, but found in greatest abundance on the shores of the Baltic, between Königsberg and Memel, where it is thrown up by the sea. It is a hard, translucent, brittle substance, having a specific gravity of 1.07. It is without taste or smell, except when heated. It then emits a fragrant odor. Its most remarkable quality is its capability of becoming negatively electric by friction. Indeed, the word *electricity* is derived from the Greek for *amber* *ἤλεκτρον*. It sometimes contains remains of extinct species of insects. It yields by distillation an empyreumatic oil consisting of a mixture of hydrocarbons and succinic acid. It is now used chiefly for the mouth-pieces of pipes and for beads, and in the arts for amber varnish. In mineralogy it is called *succinite*. Artificial *amber* is for the most part colophony.

3 In the English versions of the Old Testament (Exod 1 4, 27, viii 2) used to translate the Hebrew word *chashmal*, a shining metal, rendered in the Septuagint *ēlektron*, and in the Vulgate *electrum*. See *electrum* — 4 Liquid-

ambry, *n.* See *ambry*.
ambry, *n.* Plural of *ambry*.
ambulacra (am-bū-lā'krā), *a* [*ambulacrum* + *-al*] Of or pertaining to an ambulacrum, or to the ambulacra, of an echinoderm—**Ambulacral face**, **ambulacral aspect**, that surface of an echinoderm which bears the ambulacra, corresponding in a starfish to the oral aspect, that upon which the creature creeps—**Ambulacral groove**, a furrow which marks the course of an ambulacrum.

[In a starfish] a deep furrow, the *ambulacral groove*, occupies the middle of the oral surface of each ray, and is nearly filled by contractile sucker-like pedicels, apparently arranged in four longitudinal series. *Huxley*, *Anat. Invert.*, p. 475.

Ambulacral metameres, the divisions of the body of an echinoderm as marked or determined by the ambulacral system, as the five fingers or rays of a starfish. See *extra* under *ambulacral vessels* and *cut* under *Astrophyton*—**Ambulacral nerve**, a nerve which is in relation with the ambulacra.

When the suckers of an ambulacrum [of a starfish] are cut away, a longitudinal ridge is seen to lie at the bottom of the groove between their bases. This ridge is the *ambulacral nerve*. Followed to the apex of the ray it ends upon the eye and its tentacle, in the opposite direction, it reaches the oral disk. *Huxley*, *Anat. Invert.*, p. 478.

Ambulacral neural canal, a tube of which the ambulacral nerve forms the outer wall—**Ambulacral ossicle**, one of a double row of small hard plates which come together in the ambulacral groove, extending from its sides to its middle line. Also called *vertebral ossicle*. See *cut* under *Asteroida*—**Ambulacral plate**, one of those coronal plates of a sea urchin which are perforated to form part of an ambulacrum. See *cut* under *ambulacrum*.

In the ordinary Echinus or sea urchin of these plates there are twenty principal longitudinal series, constituting the great mass of the corona, and ten single plates, which form a ring around its aboral or apical margin. The twenty series of longitudinal plates are disposed in ten double series—five ambulacral and five interambulacral. Each *ambulacral plate* is subdivided by a greater or less number of sutures into a corresponding number of minor plates, called pore plates. *Huxley*, *Anat. Invert.*, p. 486.

Ambulacral sac, in echinoderms, that portion of the visceroperitoneal sac of the embryo which lays the foundation for the whole system of the ambulacral vessels. See *also* *peritoneal* and *Holothuroidea*—**Ambulacral system**, the water vascular system (which see, under *water vascular*).

lar) of echinoderms—**Ambulacral vesicle**, a sac situated upon the aboral face of an ambulacral ossicle—**Ambulacral vessels**, the water vascular channels of the ambulacra. See *cut* under *Echinoderma*.

Another marked peculiarity of the Echinoderm type is the general, if not universal, presence of a system of *ambulacral vessels*, consisting of a circular canal around the mouth, whence canals usually arise and follow the middle line of each of the ambulacral metameres. *Huxley*, *Anat. Invert.*, p. 4.

Circumoral ambulacral vessel, that into which a radial canal of the ambulacral system of vessels opens at its oral end—**Radial ambulacral vessels**, those which radiate from the central or circular vessel which surrounds the gullet.

Ambulacraria (am'bū-lak-rā'ri-a), *n* pl [NL, < *ambulacrum* + *-aria*] 1 A branch or subkingdom of animals, constituted by the Echinodermata and Enterozoa, and divided into Radiata and Bilateralia, the latter represented by the genus *Balanoglossus* alone. *Mechnikoff*—2t [l c] The coronal ambulacra of sea-urchins.

Ambulacrata (am'bū-lak-rā'ta), *n* pl [NL, neut pl of *ambulacratus*, < *ambulacrum*] A term applied by E. R. Lankester to a branch of echinoderms consisting of the *Holothuroidea*, *Echinoidea*, and *Isteroidea*, or sea-cucumbers, sea-urchins, and starfishes, as collectively distinguished from the crinoids or *Tentaculata* (which see).

ambulacriform (am-bū-lak-rī-fōrm), *a* [*L* *ambulacrum* + *forma*, form] Possessing the form or appearance of an ambulacrum.

ambulacrum (am-bū-lā'krum), *n*, pl *ambulacra* (-krā) [NL, use of *L* *ambulacrum*, a walk,

A three ambulacral plates of *Echinus spheer* showing sutures of the pore plates of which each ambulacral plate is composed. B, a portion of the extent of the petaloid ambulacrum of a clypeastrid.

alley, < *ambulare* see *ambulate*] In *zool*, a row, series, or other set of perforations in the shell of an echinoderm, as a sea-urchin or starfish, through which are protruded and withdrawn the tube-feet or pedicels. Each such row or set of holes usually forms a narrow grooved line from base to apex of a sea urchin, and from the center to the end of each ray of a starfish, along the oral aspect of the body. Each set or radiating series of perforations is an ambulacrum, the several rows together being the ambulacraria. The usual definition of ambulacraria as the perforated spaces through which the tube feet are protruded leaves a doubt whether an ambulacrum is not one such perforated space. *Ambulacraria* is sometimes used for the tube feet themselves, collectively, in which case it properly signifies several sets or series of tube feet, not several tube feet of any single row or series.

The ambulacraria present important variations in the three divisions of the Echinoderm. *Huxley*, *Anat. Invert.*, p. 480.

In Macleay's system of classification, a term borrowed from W E Leach to designate a subclass of *Insecta* by which the myriapoda, thysanura, and anoplura "insects" should be collectively contrasted with the true insects, which undergo metamorphosis. Myriapoda being excluded from the class *Insecta*, and *Insecta* being included with insects that are not thoroughly ametabolous, *Ametabola* is by some authors restricted to the collembolous and thysanurous insects. The term is correlated with *Hemimetabola* and with *Metabola*.

M Leach has formed them [Myriapoda] into two orders, Chilopoda and Chilognatha raising them, together with the two other orders, Thysanura and Anoplura (or Parasita, Latr), and certain annulated worms, into a distinct class, to which he applied the name of *Ametabola*, with which each had proposed only for the spring tailed insects and lice. Amen was always represented in human form, and was of a much higher order than the ram-headed divinity the god of life worshiped especially at the famous oracle sanctuary of the Libyan oasis of Ammon (now Siwah). The latter type was confused by the Greeks and Romans with that of Amen-Ra and was adopted by them as *Zeus Ammon* or *Jupiter Ammon* but in art was generally idealized so that only the horns sometimes with the ears of the ram were retained springing from a human head

ammonia (a-mô-ni-â), *n* [*< NL (Bergmann, 1782), < L (sal) ammoniacum* see *ammoniac*]

1 The modern name of the volatile alkali, NH₃, formerly so called to distinguish it from the more fixed alkalis. It is a colorless gas, very soluble in water, having a pungent and suffocating smell, and a transient alkaline effect on vegetable colors. It can be liquefied by pressure and frozen by a mixture of solid carbonic acid and ether in a vacuum. Its density is only about half that of atmospheric air. It is a strong base and forms a great number of salts which are isomorphous with those of potassium and exhibit a close analogy to them. It is found in minute quantity in air, and is a natural product of the decay of animal substances. It is procured artificially by the destructive distillation of nitrogenous organic matters such as bones, hair, horns, and hoofs, and is largely obtained as a by-product in the manufacture of illuminating gas from coal. Ammonia is used very largely in medicine and the arts, chiefly in solution in water under the name of *liquor ammoniac*, *aqueous ammonia*, or *spirits of hartshorn*. (See *aqueous ammonia* under *aquea*) Among the more important salts of ammonia is ammonium chloride or sal ammoniac, NH₄Cl which formerly was the source from which all ammonium salts were prepared. It is largely used in dyeing, and in soldering and tinning. At present ammonium sulphate (NH₄)₂SO₄ is the starting point for the manufacture of ammonium salts, being made in large quantity from gas liquor. It is also used as a fertilizer. There are several ammonium carbonates. The commercial article, called *sal volatile*, is a mixture of hydrogen ammonium carbonate and ammonium carbamate. See *ammonium*

It is inflammable and soluble in water and spirit of wine and it is used as an expectorant and as a stimulant in certain phlegmas. The so-called gum ammoniac from Morocco (which is with little doubt the *ammoniacum* of the ancients) is of uncertain origin, but is probably obtained from some species of *Taocetum*. Also written *ammonite*. See *ammonite*.

It includes most of the order *Ammonia*.

ammonium (a-mo'i-m-i-um), *n* [*NL* (Berzelius, 1804) *< ammonia + -ium*]. A name given to the hypothetical base (NH_4) of ammonia, analogous to a metal, as potassium. It has not been isolated. If mercury at the negative pole of a galvanic battery is placed in contact with a solution of ammonia or ammonium chloride and the circuit is completed the mass swells to many times its former volume and an amalgam is formed which at the temperature of 70° or 80° F. is of the consistency of butter, but at the freezing point is a firm and crystallized mass. This amalgam is supposed to be formed by the metallic base ammonium and is the nearest approach to its isolation. On the cessation of the current the amalgam decomposes into mercury, ammonia and hydrogen, the two latter escaping as gas in the proportions expressed by their atomic weights, namely, H and NH₃. **Ammonium bases**, compounds representing one or more molecules of ammonium hydrate in which monatomic or polyatomic radicals replace the whole or part of the hydrogen as seen in tetraethyl ammonium iodide, $N(C_2H_5)_4I$.

amnion (am'ni-on), *n*, pl *amnia* (-a) [*NL*, *< Gr. amnion*, the membrane around the fetus (also called *apron* or *chorion*), also the bowl in which the blood of victims was caught at the sacrifices, *< apion*, a lamb; see *agnus*]. 1 In *anat.* and *vertebrate zool.*, one of the fetal appendages, the innermost one of the membranes which envelop the embryo of the higher vertebrates, as mammals, birds, and reptiles, the lining membrane of a shut sac, familiarly called the "bag of waters," in which the fetus is contained. An amnion is developed in those vertebrates only which have a fully formed allantois; hence it is absent in the *Lophopoda* or fishes and amphibia, but present in all *Sauropsoda* or reptiles and birds, and in *Mammalia*. The amnion is formed at a very early period in the life of the embryo, by a duplication of the blastodermic layer, which, carrying with it a layer of mesoderm from the somatopleuric division of the latter, rises on all sides about the embryo, the folded edges coming together to form a shut sac in which the embryo is inclosed. From this mode of growth, it is obvious that what was the outer side of the amniotic folds becomes the inner side of the sac when it has shut, so that the epiblastic layer is internal, the mesoblastic external, the processes of invagination being comparable to that by which in the case of the primitive, trace of the embryo, a layer of epiblast is converted into the lining of the spinal canal. Only that fold of membrane which is next the body of the embryo com-

potes the amnion proper, the other or outer fold in contact with the enveloping primitive chorion (vitelline membrane or yolk sac) either disappearing or taking part in the formation of the permanent chorion. As long as this outer fold is recognizable as a membrane, it bears the name of *falsum amnion*. The shut sac of the amnion contains the liquor amnii, a bland, albuminous, serous fluid in which the fetus is immersed. In parturition, rupture of the sac is followed by the bursting of the waters. Some times a portion of the sac adheres to the head of the child, fitting like a skull cap, such an infant is said, in the language of midwives, who commonly regard the circumstance as a good omen, to be "born with a caul." Those verte-

brates which possess an amnion are termed *Amniotata*, those which do not, *Amniotata* terms coincident respectively with *Allantoides* and *Amniotoides*.
3. In *entom*, a membrane which surrounds the larva of many insects, as the millepedes (*Iulida*), for some time after they are hatched from the egg. It is regarded by some as the analogue of the amnion of a vertebrate.

In many insects and in the higher vertebrates, the embryo acquires a special protective envelope, the amnion, which is thrown off at birth. *Huxley, Anat. Invert.*, p. 67.

3. A reflected portion of a membrane, in ascidians, which lines the inner wall of the ovisac, and forms a kind of amniotic investment of the embryo.

It is the cavity left between this amnion and the inner hemisphere of the blastoderm which becomes the pericardial blood sinus. *Huxley, Anat. Invert.*, p. 533.

4. In *bot*, a name formerly given to the fluid contents of the embryo sac.

Sometimes erroneously written *amnos*.
False amnion, the part of the original amniotic membrane left lining the chorion after the amniotic sac proper is formed by a duplication and invagination of a part of the original membrane. It disappears either by absorption or by taking part in the development of the chorion. Also called *corion ula serosa*.

Also called *Amniota*.

[*cap*] A genus of microscopic rhizopodous *Protozoa*, of which *A. difflua*, common in all fresh-water ponds and ditches, is the type. It exists as a mass of protoplasm, and moves about and grasps particles of food, etc., by means of pseudopodia, or finger-like processes, which it forms by protruding portions of its body. From thus continually altering its shape it received its former name of *proteus animalculæ*. Within the body are usually found a nucleus and nucleolus, and certain clear spaces, termed *contractile vesicles*, from their exhibiting rhythmic movements of contraction and dilatation. There is no distinct mouth, and food seized by means of the pseudopodia is engulfed within the soft sarcode body and by any portion of its surface, the apertures by which the food is taken in closing up immediately after its reception. Reproduction takes place in several ways, but chiefly by fission, whereby an amöba simply divides into two portions, each of which becomes a distinct individual. Several other species have been described, but the reason to think that some of these, at least, may be early forms of other and more complex animals, or even of plants. The term appears to have been first used by Ehrenberg in 1830, as the name of a genus of his *Polygastrea*.

In popular language, animals living both on land and in the water, those which voluntarily and habitually enter that element, though not able to breathe under water, such as frogs, turtles, crocodiles, seals, walrus, otters, beavers, hippopotami, etc.—2. [cap.] In *zool.*, a name variously used. (a) In the Linnaean system (1760), the third class of *Animalia* including all *Reptilia*, *Batrachia*, and various fishes and fish-like vertebrates. It was divided into three orders: (1) reptiles furnished with feet and breathing by the mouth (*Testudo*, *Draco*, *Lacerta*, *Rana*), (2) footless serpents, also breathing by the mouth (*Crotalus*, *Boa*, *Colebris*, *Anaxus*, *Amphisbaena*, *Cecilia*), (3) finned swimmers (*Nautica*, *Amphibia*) breathing by lateral branchial gills, comprising 14 genera of fishes and fish-like vertebrates as the *Marasiphanthia* and *Squali*. (b) In Cuvier's system (1817) a tribe of carnivorous mammals intervening between *Carnaria* and *Marsupialia*, containing the seals and walrus, or plumped *Caracaras* — thus exactly equivalent to the *Pinnipedia* of modern naturalists. Cuvier had earlier (about 1799) placed the *Amphibia* next to the *Cetacea*, both comprising mammals with feet adapted for swimming, as distinguished from those with claws or with hoofs. (c) A class of Ichthyopsidan vertebrates, corresponding to the order *Batrachia* of Bronn and Cuvier, containing animals that breathe both in the water and in the air at the same or at different periods of their lives, and have either permanent gills or gills later superseded by lungs, or gills and lungs simultaneously. The gills are usually external. Respiration is also usually effected to some extent by the skin. Limbs are either present or absent, and there are no fins in the adult. The *Amphibia* undergo metamorphosis, the larval forms being more or less fish-like, the adult developing limbs. They are anamniotic and anallantoic, oviparous and cold-blooded. The heart has two auricles and one ventricle. The skull is dicondylial with an unossified basi occipital and a parapschondium. The *Amphibia* have been very generally called *Batrachia*, after Cuvier, but the latter term is now usually restricted to an order *Batrachia* of the class *Amphibia*. The *Amphibia* include all the animals commonly called frogs, toads, newts, efts, tritons, salamanders, siris, axolotls, etc. By some they are divided into *Anura* and *Urodela*, the tailless and tailed *Amphibia*. and Romans, a vessel, usually tall and slender,
having two handles or ears, a narrow neck, and
generally a sharp-pointed base for insertion into
a stand or into the ground used for holding wine,
oil, honey, grain, etc. Amphorae were commonly
made of hard baked clay, unglazed, but Homer mentions
amphorae of gold; the Egyptians had them of bronze, and
vessels of this form have been found in marble, alabaster,
glass, and silver. The stopper of a wine filled amphora was

covered with pitch or gypsum, and among the Romans
the title of the wine was marked on the outside, the date
of the vintage being indicated by the names of the consuls
then in office. Amphorae with painted decoration, having
lids, and provided with bases enabling them to stand in-
dependently, served commonly as ornaments among the
Greeks, and were given as prizes at some public games,
such as cups are now given as prizes in racing and athletic
sports. The Panatheniac amphora were large vessels of this
class bearing designs relating to the worship of Athena,
and filled with oil from the sacred olives, were given at
Athens as prizes to the victors in the Panatheniac games

In Malabar the persons of Rajas were sacred. To shed the blood of a Raja was regarded as a heinous sin, and would be followed by a terrible revenge. If the Raja of Cochín was killed, his subjects ran amok for the rest of their lives.

Syn. 3 Amuse, Divert, Entertain, Beguile, occupy, please, enliven. *Amuse* may imply merely the prevention of the tedium of idleness or emptiness of mind. As, I can amuse myself by looking out at the window or it may suggest a stronger interest as, I was greatly amused by their tricks. *Divert* is to turn the attention aside, and (in the use considered here) to something light or trifling. *Entertain* is to engage and sustain the attention by something of a pleasing and perhaps instructive character, as conversation. Hence the general name *entertainment* for lectures, exhibitions, etc., designed to lull rest in this way.

Whatever *amuse* serves to kill time to lull the faculties and banish reflection. It may be solitary, sedentary, and lifeless whatever *diverts* causes mirth and provokes laughter, it will be active, lively, and tumultuous. What ever *entertains* acts on the senses and awakens the understanding. It must be rational and is mostly social. *Crabb* *Beguile* is, figuratively, to cheat one out of weariness, of dull time, etc. The word is as often thus applied to the thing as to the person. As, to beguile a weary hour, to beguile one of his cares.

I am careful to amuse you by the account of all I see

an, *a* (an, a, or an, ä) [*< ME an, before a vowel, occasionally before a consonant, a, before a consonant (see a²), < AS an, an, with the reg. adj. declension in sing and pl (pl āne, some, certain), and the same word as an, one, its use as an indef. art. being comparatively rare*]. When so used, it was without emphasis, and became in ME short in quantity (hence E short an, a), while the numerical an, retaining its emphasis and quantity, developed into E one, pronounced on (as in *only, at-one, at-one*), in modern times corrupted to won and finally to wun. See *one*.

The indefinite article. As between the two forms of this word, the general rule is that an be used before an initial vowel sound of the following word, and a before an initial consonant sound. Thus, an eagle, an answer, also an hour (the h being silent), and a bird, a youth, a wonder, also a use, a eulogy, a one (these three words being pronounced as if they began with n or u). But an is still sometimes used before a consonant sound, especially before the weak consonant h, and in written style, and in more formal spoken style, an is by many (especially in England) required before the initial h of a wholly unaccented syllable as if such an h were always there, thus, an hotel, but a hostess, an historian, but a history, an hypothesis, but a hypothetical. In colloquial speech, and increasingly in writing, a is used in all these cases alike. As by its derivation, so also in meaning an or a is a weaker or less distinct one. (1) In certain phrases, and with certain nouns, it still has nearly the value of one. Thus, two of a trade, they were both of a size, a hundred a thousand, a million. (2) Usually as the indefinite article proper, it points out in a loose way an individual as one of a class containing more of the same kind, thus, give me a pint of milk, he ate an apple, they built a house, we see a man, the earth has a moon, our sun is a fixed star. (3) Hence, before a proper noun it implies extension of the name or character of the individual to a class, thus, he is a Cicero in eloquence, they built up a new England in America, that is a person like Cicero, a country like England. (4) It is used apparently, before a plural noun, as if for many (now only great many or good many) stands between, thus, a few apples, a great many soldiers, but the plural noun is here historically a genitive participle dependent on the many. (5) It is used distributively, or with the meaning of each or every, in such phrases as two dollars a piece, three times a day, five cents an ounce, but a or an is here historically a preposition. See *a*. An or a always precedes the noun to which it belongs, and in general also any other adjective word qualifying the same noun, but what and so come before it, thus, what a shame! such a beauty, and so also any adjective preceded by hot, or so or as, or too, thus, how great a calamity, so rare a case, as good a man too early a death. Many a is a phrase of peculiar meaning. See *many*.

an (an, an, con) [A reduced form of *and*, existing from the earliest ME period, and often then so written, but in modern literature an for *and* and copulative is admitted only in representations of dialectal or 'vulgar' speech and is then usually printed *an*. In conversation, however, though not in formal speech, the *d* is generally dropped, especially before a word beginning with a consonant, and the vowel may be weakened to the point of vanishing. An for *and*, it, is archaic in literature, and is generally printed *an*, in distinction from and copulative. I. Co-ordinate use. And, same as *and*, A.

The name is best known historically as applied to the followers of Thomas Muncie, clerk of the peasants war in Germany, who was killed in battle in 1525 and to those of John Matthys and John Bokeloh or John of Leyden who committed great excesses while attempting to establish a socialist kingdom of New Zion at Mount Zion at Munster in Westphalia, and were defeated in 1555 their leaders being killed and hung up in a cage which are still preserved in that city. The name has also been applied to bodies of very different character in other respects, probably always in an opprobrious sense since believers in the sole validity of adult baptism refuse to regard it as rebaptism in the case of persons who had received the rite in infancy. It is now most frequently used of the Mennonites. See *Mennonite*

The *analysis* of a material object consists in breaking it up into those other material objects which are its elements and it is only when we know some thing of the properties of these elements as they exist separately that we regard an *analysis* of the whole as satisfactory *Mind, IV. 80*

2 The regressive scientific method of discovery, research into causes, induction—**3** In *math* (*a*) Originally, and still frequently, a regressive method, said to have been invented by Plato, which first assumes the conclusion and gradually leads back to the premises The thirteenth book of Euclid's Elements has the following definition, which is not supposed to be by Euclid, but which is ancient, and perhaps by Euclid Analysis is the proceeding from the thing sought, as conceded, by consequences to some conceded truth *synthesis* is the proceeding from the conceded by consequences to the truth sought According to Pappus *analysis* is of two kinds *theoretical* so called because used in research into truth and *probative*, so called because used in the solution of problems In the former, the proposition to be proved is

assumed as true, and consequences are drawn from it until something conceded is reached, which if it is true involves the truth of the thing sought, the demonstration corresponding to the *analysis* In the latter the construction sought is assumed as already known and consequences are deduced from it until something given is reached

(*b*) Algebraical reasoning, in which unknown quantities are operated upon in order to find their values *Pata* (*c*) The treatment of problems by a consideration of infinitesimals, or something equivalent, especially by the differential calculus (including the integral calculus, the calculus of variations, etc.) often called *infinitesimal analysis* This is the common meaning of the word in modern times Hence—(*d*) The discussion of a problem by means of algebra (in the sense of a system of symbols with rules of transformation), in opposition to a geometrical discussion of it, that is, a discussion resting directly upon the imagination of space thus, analytical geometry is the treatment of geometrical problems by *analysis*

4 A syllabus or synopsis of the contents of a book or discourse, or of the principles of a science *Analysis of a plant*, an examination of its structure and characters as a preliminary to its determination—**Chemical analysis**, *Diophrantine analysis*, etc. See the adjectives **Fluxional analysis** See *method of fluxions*, under *fluxion* **Gasometric analysis**, *harmonic analysis*, etc. See the adjectives **Qualitative analysis**, in *chem*, the detection of the constituents of a compound body in distinction from *quantitative analysis*, or the determination of the amounts and proportions of the constituents—**Spectrum analysis** See *spectrum*—**Syn.** *Issue, Inquiry, See also* *anal.*

The *analyst* has not very many resources at his disposal for separating an intimate mixture of several bodies *Top. Sci. Mo., XXX. 903*

analytic, **analytical** (an-î'tîk, -î-kul), *a* and (*n* in the first form) *n* [*< ML. *analyticus*, < Gr. *análytikos*, analytic, < *análysis*, dissolution, verbal adj. of *análysis*, dissolve, resolve, analyze see *analysis*] **I** *a* **1** Relating to, of the nature of, or operating by analysis opposed to *synthetic*, *synthetical* **2**, an *analytic* mode of thought*

His [Weber's] mind was *analytical* rather than constructive, and his restlessness of life was indicative of a certain instability of temper *H. P. Scudder, South Webster, iv*

2 In the *Kantian logic*, explanatory, involving a mere analysis or explication of knowledge, and not any material addition to it

In all judgments in which there is a relation between subject and predicate (I speak of affirmative judgments only the application to negative ones being easy), that relation can be of two kinds 1. Either the predicate B belongs to the subject A as something contained (though covertly) in the concept A, or B lies outside of the sphere of the concept A though somehow connected with it In the former case I call the judgment *analytical* In the latter, *synthetical* *Analytical* judgments (affirmative) are therefore those in which the connection of the predicate with the subject is conceived through identity while others in which that connection is conceived without identity may be called *synthetical*

Kant, Critique of Pure Reason (tr. by Max Müller)

3 In *philol*, deficient in inflections, and employing instead particles and auxiliary words to express modifications of meaning and to show the relations of words in a sentence as, an *analytic language*—**Analytical chemistry**, a method of physical research in which compound substances are resolved into their elements **Analytical definition** See *definition* **Analytical geometry**, geometry treated by means of ordinary algebra with a reference, direct or indirect to a system of coordinates See *coordinate*

In ordinary rectangular coordinates for example, there is just one point of space for every set of values of the three variables *x, y, z* If, now an equation is assumed between these variables some of the sets of otherwise possible values will be excluded, and thus some of the points of space will be denied to us, and we shall be restricted to a certain locus or place and since the number of independent variables is in consequence of the equation, reduced by one, the number of dimensions of the locus at any one point will be one less than that of space, so that the locus will be a surface By the use of such equations of loci every problem of geometry is reduced to a problem of algebra and the whole doctrine of geometry is mathematically identified with the algebra of three variables Thus to discover that when four equations subsist between three unknown quantities, they can be satisfied simultaneously, amounts to discovering that when a certain geometrical relation subsists between four surfaces, they meet in a common point The idea of analytical geometry is exclusively due to the genius of Des Cartes (1596-1650) who published his *Geometrie*, containing illustrations of the new method, in 1636

Analytical jurisprudence, a theory and system of jurisprudence wrought out neither by inquiring for ethical principles or the dictates of the sentiment of justice, nor for the rules which may be actually in force but by analyzing, classifying, and comparing various legal conceptions The best known of the analytical jurists are Bentham and

Anchors are generally
 made of iron and con-
 sist of a strong shank
a, at one extremity of
 which is the crown *c*,
 from which branch out
 two arms *b*, curved in-
 ward, and each termi-
 nating in a broad palm

 the palm or bill. At the
 other end of the shank
 is the stock *e*, a trans-
 verse piece, behind which is a shackle or ring to which a ca-
 ble may be attached. The principal use of the stock, which
 in nearly all anchors is now made of iron and is placed at
 right angles to the curved arms *b* is to cause the arms to
 fall so that one of the flukes shall enter the ground. Accord-
 ing to the various forms and uses, anchors are called *star-*

Trotman's Anchor

Many im-
 provements and novelties in the shape and construction of
 anchors have been introduced in recent times. The prin-
 cipal names connected with these alterations are those of
 Lieut Rodgers, who introduced the *hollow shanked anchor*
 with the view of increasing the strength without adding
 to the weight. Mr Porter, who made the arms and flukes
 movable by pivoting them to the shank instead of fixing
 them immovably, causing the anchor to take a rather and
 firmer hold, and avoiding the danger
 of fouling the cable. Mr Trotman,
 who has further im-
 proved Porter's in-
 vention, and Mr
 Martin, whose an-
 chor is of very pecu-
 liar form, and is con-
 structed so as to be

self canting, the arms revolving through an angle of 30
 either way, and the sharp points of the flukes being always
 ready to enter the ground. Of the many other forms, all

(except Tyzack's anchor, which has only one arm, pivoted
 on a bifurcation of the shank and arranged to swing be-
 tween the two parts) are more or less closely related to the
 forms illustrated. The anchor is said to be a *cockbill* when
 it is suspended vertically from the cathead ready to be let
 go. *apeak* when the cable is drawn in so tight as to bring
 it directly under the ship. *atrap* or *catch* when it is just
 drawn out of the ground in a perpendicular direction,

or drums exposed to the wind, and so arranged as to yield to its pressure and indicate the amount by their movements

Linds's anemometer consists of a glass tube bent into the form of an inverted siphon graduated partly filled with water, and mounted as a weathercock. To one of its open ends a metallic cylinder of the same bore as the tube is attached at right angles. The pressure of the wind blowing into this causes the water to sink in one arm of the tube and to rise in the other, and the difference of level of the two columns of water, which is measured by the amount of fall plus the amount of rise, as shown by the graduated scales, gives the force or pressure of the wind. By the use of mechanical or electrical appliances anemometers may be made to record as well as measure variations in the velocity and pressure of the wind. When they record the velocity or direction, or both, they are sometimes called *anemographs*, when they indicate the direction only, they are called *anemographs*, when they automatically record velocity, direction, and pressure, they are called *anemotographs* or *anemotrographic registers*

= **Syn** *Anger* *Wrath*, *Indignation*, *Resentment*, *Wrath*, *Ire*, *Choler*, *Rage*, *Fury*, passion, displeasure, indignation, irritation, gall, bile, spleen. *Wrath* is the least forcible of these words, expressing the annoyance and impatient chafing of one whose mood has been crossed whose expectations have not been realized, etc. *Indignation* may be the most high minded and unselfish it is intense feeling, in view of grossly unworthy conduct, whether toward one self or toward others. The other words denote almost exclusively feeling excited by the sense of personal injury. *Anger* is a sudden violent feeling of displeasure over injury, disobedience, etc., accompanied by a retaliatory impulse. It easily becomes excessive, and its manifestation is generally accompanied by a loss of self control. *Resentment* is the broadest in its meaning, denoting the instinctive and proper recoil of feeling when one is injured, and often a deep and bitter brooding over past wrongs, with a consequent hatred and settled desire for vengeance. It is, in the latter sense, the coolest and most permanent of these feelings. *Wrath* and *ire* express sudden feeling of great power, and are often associated with the notion of the superiority of the person, as the *wrath* of Jove, the *ire* of Achilles. They are often the result of wounded pride. *Ire* is poetic. *Wrath* has also an exalted sense expressive of a lofty indignation visiting justice upon wrong doing. *Rage* is an outburst of anger, with little or no self control, *fury* is even more violent than *rage*, rising almost to madness. The chief characteristic of *choler* is quickness to rise, it is irascibility, easily breaking into a high degree of resentful feeling

The Angles were the most numerous of these settlers, and founded the three kingdoms of East Anglia, Mercia, and Northumbria. From them the entire country derived its name *England*, the "land of the Angles." See *Anglian*, *Anglo-Saxon*, and *English*

In geom, a plane angle is one formed by two lines straight or curved, which meet in a plane, a *rectilinear* angle, one formed by two straight lines. The point where the lines meet is called the *vertex* of the angle, or the *angular point* and the lines which contain the angle are called its *sides* or *legs*. The magnitude of the angle does not depend upon the length of the lines which form it, but merely on their relative positions. It is measured by the length of a circular arc of unit radius having for its center the vertex of

the angle, or point of intersection of the sides. Thus the angle FFA, fig 1, is measured by 82 degrees of the circumference, or the arc AF. Angular magnitudes are also expressed in *quadrants* of four to the circumference, in *hours* of six to the quadrant, in *sexagesimal degrees* of 60 to the quadrant (rarely) in *centesimal degrees* of 100 to the quadrant etc. The arc whose length is equal to the radius subtends an angle of 57° 17' 44" nearly. Theoretically, the measure of an angle is the logarithm of the anharmonic ratio made by the two sides with the two tangents to the absolute intersecting at the vertex. Angles receive different names, according to their magnitude, their construction, their position, etc. When one straight line in-

tersects another so as to make the four angles so formed equal, these angles are called *right angles*, and each is measured by an arc equal to one fourth of a circumference, or 90 degrees

Thus, ACD, fig 2, is a *right angle*. An angle which is less than a right angle is *acute*, as ADE. An obtuse angle is one which is greater than a right angle, as AEB. Acute and obtuse angles are both called *oblique*. In opposition to *right* an *angle*, a *curved* angle is formed by the meeting of the tangents to two curved lines at their point of intersection. *Adjacent* or *contiguous* angles are such as have one leg common to both angles, both together being equal to two right angles. Thus, in fig 2, ADE and AEB are *adjacent angles*. *Conjugate* angles are two angles having a common vertex and common legs, one being convex, the other concave. A *straight* angle is an angle of 180°. A *reflex* angle is the same as a convex angle. (See *conjugate angles*, above.) *Exterior*, *external*, or *outward* angles are the angles of any rectilinear figure without it, made by producing one of the sides at each vertex, the angles formed within the figure being called *interior angles*. When one line intersects a pair of lines in a plane, of the eight angles so formed, those which are between the pair are called *interior*, those without *exterior*. Of the interior angles, a pair for different sides of the intersecting line, and at different intersected lines, are called *alternate* (which see). See *radian*

See *depression*—Angle of descent, in *ordnance*, the angle which a tangent to the trajectory of the projectile makes with the horizontal plane passing through the point of first fire or the point of impact—Angle of direction, in *naut*, an angle contained by the lines of direction of two conspiring forces—Angle of divergence, in *bot*, the angle between two successive leaves on the same stem. See *craniometry*—**Spherical angle**, an angle on the surface of a sphere contained between the arcs of two great circles. Thus, if AB and CE be arcs of great circles intersecting each other at the point B, the angle AEC is the spherical angle which they make, one with the other, and it is equal to the angle of inclination formed by the planes of the great circles AB and CE. The angle is measured by the angle formed by the tangents of the two arcs at their point of intersection—**Trisection of the angle**. See *trisection*—**Vertical angle**. See *vertical*

Several of the English scholars who are most active in the study of early English were on *Anglo-Saxon* They attack the word They are still more hostile to the suggestion which goes with the word, that the speech called *Anglo-Saxon* is different from modern English, so as to deserve a separate name They say there has been but one speech spoken in England by the Teutonic tribes and their descendants from Cerdmon to Tennyson This classic *Anglo-Saxon* differs from our English in phonology,

in vocabulary, in inflections, in the derivation of words, in syntax, in verification (see *elaboration*) and in the modes of thought The former is a synthetic German speech, with its own periods of early irregular inflection, classic cultivation decline and fall into dialects, the latter an analytic mixed speech of Romanic cultivation, with other periods of growth and classic regularity and progress And a chaos separates the two languages It is only when attention is directed to the history of etymological forms that unity can be plausibly claimed for them But while the importance of these forms in tracing the descent of languages is probably not overrated, their weight in establishing identity or similarity may easily be

The proposed use of *Old English* [in place of *Anglo-Saxon*] does not distinguish but confounds all the periods of *Anglo-Saxon* and the two early periods of English The reasons urged for this nomenclature are in great part sentimental It is thought to magnify the English language and race to represent

them as Low German, having an unbroken history parallel with that of the High German, and reaching through a more famous career to a more venerable antiquity. But Americans are taught to believe in mixed races, and it magnifies the English most in our eyes to represent it in the old fashion, as formed by the junction of two great languages, the bearers of the best cultivation of the Teutonic and Romanic races.

anharmonic (an-har-mon'ik), *a* [= F *anharmonique*, < Gr *an-har-mon'ik* + *harmonia*, q. v.] Not harmonic in *geom*, a term applied by Charles to an important kind of ratio introduced into geometry by Möbius. If *a*, *x*, *y*, *b* are four values of a unidimensional variable (for instance, the positions of four points on a line), then $\frac{(a-x)(y-b)}{(x-a)(b-y)}$ is called the *anharmonic ratio* of the four values. The intersections of a plane pencil of four lines with a transverse line have the same anharmonic ratio; however the transverse may be situated at infinity. This ratio is called the *anharmonic ratio* of the pencil. Anharmonic ratios are always preserved in orthographic projections. By means of these ratios, metrical properties are defined as projective properties of the absolute, or conic at infinity. See *absolute*, a. 2. If from the intersection of two lines tangents are drawn to the absolute, the logarithm of the anharmonic ratio of the pencil so formed multiplied by $\frac{1}{2\pi}$ is the angle of the first two lines. So the logarithm of the anharmonic ratio of two points together with the intersection of their connecting line with the absolute when multiplied by a constant, gives the distance of these points. *Anharmonic property*, in *geom*, a property that is connected with an anharmonic ratio

4 Of, pertaining to, or derived from animals

It may be reasonably doubted whether any form of *animal* life remains to be discovered which will not be found to accord with one or other of the common plans now known *Huxley*, Anat. Invert., p 50

Animal anæsthetic See *anæsthetic* — **Animal charcoal** Same as *bone black* — **Animal economy**, the physiological course of events in the life of an animal, the sequence of cause and effect observed in the vital activities of animals, the order of animated nature — **Animal electricity**, electricity generated in animal bodies, as, in large quantities, in the electric eel, the torpedo, and *Malapteruridae*, or, in small quantities, in nervous, muscular, and other tissues — **Animal food**, flesh or any other part of an animal which is eaten — **Animal force** See *force* — **Animal function**, any vital activity or physiological process performed in an animal economy, any organic property or character of animals. Such functions may be grouped in a few broad classes: (1) Mentality, including all activities of the mind as distinguished from those of the body, such as instinct, reason, intellect, ideation, etc. (2) Sensibility, or feeling, the capability of responding automatically to external stimuli, irritability, innervation (common to all animals in a high degree as compared with plants) (3) Locomotion usual in animals, but unusual in plants (4) Nutrition involving interstitial growth and waste and repair (common to plants and animals, but usually differently effected in the two, and with different material) (5) Reproduction, or generation a process whereby growth is devoted to the formation of separate individuals. Functions shared by all or organized in groups are called *organs* or *vegetative* functions, no functions are peculiar to animals except those of mentality. Other lesser categories of functions are sometimes named as the *digestive* function, the *excretory* function, the function of *circulation*, of *respiration*, the function of the liver, or of any part or organ, that is, the special part which it takes in the animal economy — **Animal heat**, the temperature maintained during life in an animal body, and requisite for its physiological functions. It varies from a degree not appreciably different from that of the element in which the animal lives to one much higher, the latter being the case with the highest animals. Difference in degree of animal heat is the ground of a division of the higher animals into warm blooded and cold blooded or *Hematotheca* and *Hermatotheca*. In the former a very sensibly elevated temperature is maintained. It is highest in birds, mounting some times to 112 F. In mammals a usual range is from 98 to 104 F. In man the mean normal temperature is about 99. Any considerable deviation from which is inconsistent with health. Animal heat is simply a case of chemical combustion: an analogous process goes on in plants. It is an index of the molecular motion of the body, and a measure of the work done by an animal in its vital activities — **Animal kingdom**, all animals collectively, *Animalia* one of the three grand divisions of the realm of nature (*imperium naturæ*), the other two comprising plants and minerals respectively. For scientific purposes it has been divided into classes or orders, families, genera, species and groups (with intermediate divisions often formed by prefixing *sub* or *super* to these words) whereby the classification and registration of animals are facilitated. Examples of the primary divisions are the following: (1) The Linnean system (1760) divided animals into 6 classes: I. *Mammalia*, II. *Aves*, III. *Amphibia*, IV. *Pisces*, V. *Insecta*, VI. *Vermes*. (2) The system of Cuvier (1817) proposed 4 subkingdoms and 20 classes: I. *Vertebrata* (*Mammalia*, *Aves*, *Reptilia*, *Pisces*), II. *Mollusca* (*Cephalopoda*, *Pteropoda*, *Gastropoda*, *Aciphalia*, *Brachiopoda*, *Cirrhopoda*), III. *Articulata* (*Annelida*, *Crustacea*, *Proboscidea*, *Arachnida*, *Insecta*), IV. *Radiata* (*Echinodermata*, *Protozoa*, *Acetabularia*, *Polypa*, *Infusoria*). (3) The system of Owen (1840) separated the *Protozoa* from *Animalia* proper as a separate kingdom, the latter being then divided into subkingdom I, *Invertebrata*, with 3 provinces, *Radiata*, *Articulata*, *Mollusca* and subkingdom II, *Vertebrata*. (4) In 1860 Huxley arranged the animal kingdom in the 8 primary groups: *Vertebrata*, *Mollusca*, *Molluscorum*, *Calcitrata*, *Amphibia*, *Amphibia*, *Infusoria*, *Protozoa*. No two authorities agree upon the leading divisions of the animal kingdom, but a system like the following is now quite generally accepted: Subkingdom A (with one phylum), *Protozoa*, class I, *Rhizopoda*, class II, *Gregarina*, class III, *Infusoria*, class IV, *Metazoa*, phylum I, *Calcitrata*, class I, *Spongiopoda*, class V, *Hydrozoa*, class VI, *Actinopoda*, class VII, *Ctenozoa*, phylum 2, *Echinodermata*, class VIII, *Ctenozoa*, class IX, *Asterozoa*, class X, *Cheloni*, class XI, *Holothuridea*, phylum 3, *Vermea*, class XII, *Plathelminthes*, class XIII, *Nemathelminthes*, class XIV, *Gephyrea*, class XV, *Annelida*, class XVI, *Rotifera*, phylum 4, *Arthropoda*, class XVII, *Crustacea*, class XVIII, *Arachnida*, class XIX, *Myriapoda*, class XX, *Insecta*, phylum 5, *Molluscorum*, class XXI, *Polypoda*, class XXII, *Brachiopoda*, phylum 6, *Mollusca*, class XXIII, *Cephalopoda*, class XXIV, *Pteropoda*, class XXV, *Gastropoda*, class XXVI, *Cephalopoda*, phylum 7, *Vertebrata*, class XXVII, *Pisces*, class XXVIII, *Leptocardia*, class XXIX, *Megaprosobranchia*, class XXX, *Placodermata*, class XXXI, *Reptilia*, class XXXII, *Amphibia*, class XXXIII, *Birds*, class XXXIV, *Aves*, class XXXV, *Mammalia*. Also in the singular, *animal spirit*, equivalent to nervous force or action. (b) In modern use, exuberance of health and life, natural buoyancy, cheerfulness, animation, gaiety, and good humor

Emerson, Society and Solitude

II. *n* 1 A sentient living being, an individual, organized, animated, and sentient portion of matter, in *zoö*, one of the *Animalia*, a member of the animal kingdom as distinguished from a vegetable or a mineral. The distinction from the latter is sufficient consisting in organization, interstitial nutrition, vitality, and animation, but it is impossible to draw any line between all vegetables and all

animals. Any criteria which may be diagnostic in most instances fail of applicability to the lowest forms of animal and vegetable life, and no definition which has been attempted has been entirely successful. Most animals are locomotory as well as motile: most plants are fixed. Most animals exhibit distinct active and apparently conscious or voluntary movements in response to irritation, mechanical or other, most plants do not. Most animals feed upon other animals or upon plants, that is to say, upon organic matter: most plants, upon inorganic substances. Most animals have no cellulose in their composition, nitrogenous compounds prevailing, while cellulose is highly characteristic of plants. Most animals inhale oxygen and exhale carbon dioxide, the reverse of the usual process in plants, and few animals have chlorophyll, which is so generally present in plants. Animals have usually a digestive cavity and a nervous system, and are capable of certain manifestations of consciousness, sentience, and volition, which can be attributed to plants only by great latitude in the use of the terms. See also *extract*.

Ordinary *animals* not only possess conspicuous locomotive activity, but their parts readily alter their form or position when irritated. Their nutriment, consisting of other *animals* and of plants, is taken in the solid form into a digestive cavity. Traced down to their lowest terms, the series of plant forms gradually lose more and more of their distinctive vegetable features, while the series of animal forms part with more and more of their distinctive animal characters, and the two series converge to a common term. The most characteristic morphological peculiarity of the *animal* is the absence of any such cellulose investment [of the cells as plants possess]. The most characteristic physiological peculiarity of the *animal* is its want of power to manufacture protein out of simple compounds *Huxley*, Anat. Invert., pp 43-47

F. anime*, on the fanciful that it is so called because often "anime" (*< L. animatus* see *animate*, *a*) or "alive" with insects, but *L. prop. anime* = *F. anime* (Cotgrave), now *anime*, *Sp. Pg. anime* (NL *anime*, *anime*, also *angum*), applied in the middle of the 16th century, and prob. earlier, to a gum brought from the East by the Portuguese, afterward applied to a similar product from the West Indies. The word, which has not been found native in the East or elsewhere, is said by Ray and others to be a Portuguese corruption of *aminua*, Gr. *amivua* (Dioscorides), a resinous gum, this name being appar. an ad. (*see amivua*, myrrh), referring to a people of Arabia bordering on the Red Sea, from whom the gum was obtained. *Islema* is a different word.] 1 The name of various resins, also known in pharmacy as *elemi* (which see). — 2 A kind of copal, the produce principally of a leguminous tree, *Trachytobium Hornemannianum*, of Zanibar. animism (an'-i-miz-m), *n* [= *F. animisme*, *< L. anima*, soul (see *animate*), + *-ism*] 1 The hypothesis, original with Pythagoras and Plato, of a force (*anima mundi*, or soul of the world) immaterial but inseparable from matter, and giving to matter its form and movements. — 2 The theory of vital action and of disease propounded by the German chemist G. E. Stahl (1660-1734), the theory that the soul (*anima*) is the vital principle, the source of both the normal and the abnormal phenomena of life. In Stahl's theory the soul is regarded as the principle of life, and in its normal action of health the body being supposed to be incapable of self movement, and not only originally formed by the soul, but also act in motion and governed by it. Hence it was inferred that the source of disease is in some hindrance to the full and free activity of the soul and that medical treatment should be confined to an attempt to remove such hindrances from it.

3. The general conception of or the belief in souls and other spiritual beings, the explanation of all the phenomena in nature not due to obvious material causes by attributing them to spiritual agency. Among the beliefs most characteristic of animism is that of a human animational soul, that is, of a vital and animating principle residing in the body, but distinct from it, bearing its form and appearance, but wanting its material and solid substance. At an early stage in the development of philosophy and religion events are frequently ascribed to agencies analogous to human souls, or to the spirits of the deceased.

Spiritual philosophy has influenced every province of human thought, and the history of animism once clearly traced would record the development, not of religion only, but of philosophy, science, and literature.

Frege, Brit. II 57

The theory of Animism divides into two great dogmas, forming parts of one consistent doctrine. First, concerning souls of individual creatures, capable of continued existence after the death or destruction of the body, second concerning other spirits, upward to the rank of powerful deities. *F. = *Syn. 2 Animosity* *Ill will, Enmity, Malice, Hostility, Hatred, Hate, Malice, Malice, Malice, Rancor, Grudge, Spite*. These words differ from those described under *animosity*, *anger*, and *antipathy* (which see) in that they represent deeper feelings or more permanent passions. *Ill will* may represent the minimum of feeling, being a willing or wishing of ill to another, generally without disposition to be active in bringing the evil about. *Enmity* is a somewhat stronger feeling, and it often gratifies itself in trifling and cowardly ways. *Animosity* is more intense than *enmity*, it is avowed and active, and what it does is more serious than the covert attacks of *enmity* or the hasty attacks of *spite*. *Malice* is pure badness of heart, delighting in harm to others for its own sake. *Hostility* is less passionate than *animosity*, but not less avowed or active, being a state of mind inclining one to aggressive warfare. *Hatred* and *hate* are the general words to cover all these feelings, they may also be ultimate, expressing the concentration of the whole nature in an intense ill will. *Malice* is more casual and temporary than *malice*, arising upon occasion furnished, and characterized by a wish that evil may befall another rather than by an intention to injure. *Malice* is malice intensified, it is hatred in its aspect of destructiveness or desire to strike at the most vital interests of another. *Rancor* is hatred or malice turned sour or bitter. It is implacable in its vindictiveness. A *grudge* is a feeling of sullen ill will or enmity, caused by a trifling wrong and likely to be appeased when it has spent itself in a similar return against the offender. *Spite* is sudden, resentful, and generally quite as well pleased to mortify as to damage another, it may be as strong as malice or as weak as pique.

ally All glassware, china, etc., which is to be subjected to great changes of temperature should be thus treated. The working of iron and steel by hammering, bending, rolling, drawing, etc., tends to harden them and make them brittle, and the original properties are restored by annealing. Steel plates and dies for bank note printing and the like are annealed in a close box with iron filings or turnings, lime, or other substances, and are thus freed from carbon and reduced to pure soft iron, in which state they will readily take, under pressure, the finest engraving from a hardened plate or die. They are then hardened again to the degree necessary for their use. In printing steel for engraving dies is commonly annealed by heating it to a bright cherry red color, and cooling it gradually in a bed of charcoal.

The body is composed of numerous (up to some 400) segments, somites, or metameres, and limbs are wanting or, if present, rudimentary and consist of the cilia or setae known as parapodia. A vascular system with red blood is usually present. The integument is soft, and composed of many layers the surface being mostly ciliated, or setose, the head is wanting or rudimentary, and in the latter case consists of a prostomium which may be ciliated or tentacles. The *Annulida* are the "worms" properly so called, of which the common earthworm, leech, and leech are characteristic examples. Most of the species are aquatic and marine. The class is differently limited by different authors, the principal variation among later writers, however, being in excluding or including the *Gephyrea*. Excluding these, as is done by the above definition, the *Annulida* have been divided into four orders: (1) *Hirudinea*, *Desmophora*, or *Suctorina*, the leeches, (2) *Oligochaeta*, *Abranchia*, *Terricola*, etc., the earthworms and their immediate allies, (3) *Chaetopoda*, *Polychaeta*, *Errantia*, etc., the free sea worms, and (4) *Cephalobranchia*, *Tubicola*, etc., the tubicolous sea worms. Another scheme divides *Annulida* into four subclasses: (1) *Archiannullida* composed of the genus *Polygordius* and its allies, (2) *Chaetopoda* including (2), (3), and (4) of the foregoing schedule, (3) *Hirudinea* or *Desmophora*, and (4) *Euterochaeta*, consisting of the genera *Balanobolus* which some authorities class with the *Ascidians* or *Chordata*.

2 In Huxley's system (1877), a superordinal division including the *Polychaeta*, *Oligochaeta*, *Hirudinea*, and *Gephyrea*, with the *Myzostomata* doubtfully added thereto a group the members of which resemble one another generally in the segmentation of the body indicated at least by the serially multiganglionate nervous centers (wanting in most *Gephyrea*) in the

presence of cilia and segmental organs, and in the nature of the larvae, which are set free when the embryos hatch.

It forms (1) compound nouns (with the accent on the prefix) in which *anti* has the attributive force of opposed to opponent opposite counter as in *antichrist* *antipope* *antichorus*, *antichorus* *antipope*, etc. (2) compound adjectives (with the accent on the radical element) in which *anti* retains its original prepositional force, against opposed to, governing the noun expressed or implied as in *antichristian*, *antipapal*, *antichristian*, etc. Such compound adjectives adopt an adjective termination as in the examples just cited or omit it as in *antichurch* *antidote* *very antiprobation*, *antirent* when it does not exist or is not readily formed. This mixture of adjective and substantive forms makes easy the development, from the compound adjectives of abstract nouns like *antidavery*, *antiprobation* etc. In form these compound adjectives, like *antichristian* *antichurch* *anti* *Sacrament*, are thus, strictly made up of *anti* with a noun and an adjective termination as *anti* + *christ* + *ian*, *anti* + *church* + *al*, *anti* + *Sacrament* + *al*, etc., but in effect they are often equivalent to and for brevity they may be marked as, *anti* + *Christian* *anti* + *clerical* etc. These compounds are especially applied to persons or parties opposed in opinion or practice to other persons or parties, or to things in medicine to remedies producing or intended to produce an effect or condition opposite to or in correction or prevention of that implied in the simple word as *antichlorous* *antipneumonic* *antidote*, etc. In the etymologies following, *anti* is treated as a mere English formative, and is not referred to the Greek except when obviously taken in connection with the radical element, directly from the Greek

The Antiburghers denied that this oath could be taken consistently with the principles of the church while the Burghers affirmed its compatibility. The result was that the church was split in two, each section establishing a communion of its own, known respectively as the General Associate Synod or Antiburghers, and the Associate Synod, or Burghers. They were reunited in 1820, after seventy-three years of separation, thus constituting the United Secession Church.

The word occurs in the Scriptures only in the Epistles of John, but the same person or power is elsewhere referred to (2 Thes II 1-12, 1 Tim IV 1-4, 2 Pet II 1). Interpretations of Scripture differ in their understanding of these references. Some suppose them to relate to a lawless but impersonal power, a spirit opposed to Christianity, some to a historic personage or potentate, as Caligula, Titus, the pope, or Luther, some to a great power for evil yet to be

manifested and gathered about a central personal agency Roman Catholic writers commonly interpret the word generically of any adversary of Christ and of the authority of the church, but specifically as the last and greatest persecutor of the Christian church at the end of the world. The name has also been applied to the pretenders to the messianic or false Christ (Mat xxiv 24), who have arisen at various periods, as being antagonistic to the true Christ. Of these as many as sixty four have been reckoned including some of little importance, and also some, as Mohammed, who cannot properly be classed among them.

4 In *logic*, the term used since Cicero (Latin *anticipatio*) to translate the "prolepsis" (πρόληψις) of the Epicureans and Stoics. It denotes any general notion considered as resulting from the action of memory upon experiences more or less similar. Such a notion is called an anticipation because once possessed it is called up in its entirety by a mere suggestion. It thus acquaints us with what has not yet been perceived, by a reference to past perceptions. Hence with later philosophers, the word denotes knowledge drawn from the mind, independent of experience, the knowledge of axioms or first principles. With Bacon an anticipation of nature is a hasty generalization or hypothesis opposed to an interpretation of nature. In Kant's philosophy, anticipation is the a priori knowledge that every sensation must have degrees of intensive quantity

See *Antilocapridae*. The members of this genus have no horns, or no bony glands, as in *Cervidae*, but have a system of leathery odoriferous sebaceous cutaneous glands. They have small hoofs, no false hoofs, slender limbs, a comparatively short and stout neck, erect, pointed ears, large liquid eyes situated directly beneath the base of the horns, extremely short tail, and a harsh stiff, brittle pelage devoid of felting quality. These singular horns are composed of agglutinated hairs hardened into solid corneous tissue, and when spouting resemble the skin covered knobs upon the head of the giraffe. Antilope (an-ti-lō-pē), *n* [*< NL, see antelope*] I. A genus of *Antilopina* (which see). The term has been used with such latitude in its application to the whole of the group *Antilopina*, and when restricted has been employed in so many different senses that it has lost whatever exact meaning it may have possessed originally, and has become a loose, fluctuating synonym of the subfamily name *Antilopina*. Even in early usage, it appears to have been applied to several different small gazel-like antelopes. It is now commonly restricted to the Asian or Indian antelope *Antilope cervicapra*. See cut under *Asian* 2† (an-ti-lōp). [I. c.] Obsolete (English) spelling of *antelope*.

Antilopidae (an-ti-lō-pī-dē), *n* pl. [*< NL, < antilope + -idae*] A family of ruminants, the antelopes. Sometimes used as a synonym of *Antilopina*. Also written *Antilopida*.

Antilopines (an-ti-lō-pī-nē), *n* pl. [*< NL, < antilope + -ina*] A subfamily of old-world and chiefly African ruminants, the antelopes, a group belonging to the family *Bovidae*. They differ from cattle in their smaller size, more lithe and graceful form, slenderer legs which are comparatively longer in the hind, and longer neck with slender vertebrae, uplifting the head. The *Antilopina* shade directly into the sheep and goats (*Ovis* and *Capra*) being separable from them by no technical characters, but the horns usually differ from the former presented by goats and sheep, though they are so diverse as to be definable by no common characters. *Antilopina* are especially numerous in species and individuals in Africa, of which continent they are the most characteristic animals. Upward of 50 African species have been described, and the rest are many others in Asia, and a few in Europe. Some 75 species are recognized by naturalists, but probably the number of genuine species is less than this. Several hundred different names, generic, specific, and vernacular have been applied to the animals, and no authors except some compilers are agreed upon the division of the group. The antelopes present the utmost diversity of stature, form, and general appearance, ranging from the smallest and most delicate gazels, staghorns, and springboks to the bulky eland, nyloghu or batheest, as large as a cow, horse, or stag, and including the singularly misshapen gnu (*Connochaetus gnu*). The Rocky Mountain goat (*Oreamnos montanus*), related to the Alpine chamois, *Rupicapra traqueus* and the goat, *Capra montanus*, another goat-like antelope, are also placed in this subfamily. The bulaline or bœvian antelopes include the bartheest (*Alcelaphus busina*), blebbock (*Alcelaphus*) and bontbuck (*A. quagga*). Four horned antelopes belong to the genus *Tetraceros*. The phillanthus and coquettish antelopes, the blawbok, duiker, etc., are placed in the genus *Cephalophus*. The staghorns are species of *Axis*, and the kudu, kudu, etc., belong to the genus *Tragelaphus*. The gazel is a large group constituting the genus *Gazella* (or *Dorcas*) and others. They include the springbok (*Antidorcas capensis*), and ar. Indian, Arabian and Syrian, as well as African. The whole of equine antelopes constitute the genus *Hippotragus*. The addax is *Addax namus*. The kudu is *Tragelaphus oryx*, as *O. kudu*. The nyloghu is *Tragelaphus traqueus*. The bontbuck antelope (so called from the antelope on the side) or the bontbuck, are species of *Tragelaphus*, as *T. oryx*, *T. madoqua*, etc. The kudu is a large antelope with twisted horns (*Tragelaphus kudu*). The eland is *Oryx capensis*. The so-called saiga antelope is the type of a different family, *Saiga* (which see). The African antelope, also belongs to a different family, *Antilocapridae* (which see). See cuts under *addax*, *eland*, *gazel*, *gnu*, and *nyloghu*. Also written *Antelopina*.

The movement spread to some other States and a national party was organized, but within about ten years it disappeared. Most of the Antimasons became Whigs. Its characteristic tenet was that freemasons ought to be excluded from public office, because they would necessarily regard their obligations to the society more than their obligations to the state. Its principles were revived in a so-called American party organized in 1876.

It takes the place of the portable altar of the Latin Church. The term is sometimes extended in the Syrian churches to a thin slab of wood consecrated for a like purpose. Also written *antimenson*.

antimere (an-ti-mēr), *n* [*< (Gr avri, against, + meros, a part)*] In *biol*, a segment or division of the body in the direction of one of the secondary or transverse axes, all of which are at right angles to the primary or longitudinal axis.

When these axes are not differentiated in any way, all antimeres are alike, and are parts arranged around the long prime axis like the spokes and felloes of a wheel around the axis of the hub. A disposition preserved with much accuracy in many of the *Radiata*, among which, for example, the arms of a starfish, the tentacles of a sea anemone or coral animal, etc., or the rows of ambulacra of a sea urchin are antimeres. Often, however, the transverse axes are differentiated, some being shorter, others longer, giving rise to sides as right and left, in the direction of the longer transverse axis, in which case right and left parts are antimeres. This constitutes bilateral symmetry. Parts which may be perceived to correspond at opposite poles of the other (shorter) transverse axis, constituting dorsolateral symmetry, are also antimeres, but this condition is obscure. Likewise, again, parts along the primary longitudinal axis, or at its poles which may be observed or be conceived to constitute anteroposterior symmetry, are essentially antimeric, but this condition like dorsolateral symmetry, is obscure, while the serial succession of like parts along the prime axis, as the rings of a worm, crustacean, or insect, and the double rings of a vertebrate, is so marked that antimeres of this kind are not called antimeres but *metamerer*, such are the ordinary segments, somites, arthromeres, or diarthromeres of any articulate or vertebrate animal. Antimeres is therefore practically restricted to such radiating and bilateral parts as are more or less symmetrical with one another. See *caudopod*.

A metal of a white color and bright luster which does not readily tarnish, having a specific gravity of 6.7, crystallizing in the rhombohedral system, and in the mass ordinarily showing a crystalline structure and highly perfect cleavage. It conducts both heat and electricity with some readiness, but less perfectly than the true metals, and differs from them also in being brittle like arsenic. It melts at 480° (806° F) and volatilizes slowly at a red heat when melted in the air it oxidizes readily, forming antimony trioxide, Sb_2O_3 . Antimony occurs uncombined in nature to a limited extent usually in granular or foliated masses often with a botryoidal or reniform surface. Many compounds of antimony are found in nature the most important of them being the sulphid, Sb_2S_3 , called gray antimony, antimony glance or stibnite. Dyscrasite is a compound of antimony and silver. There are also a number of minerals containing antimony sulphur, and lead (like jamesonite), or antimony, sulphur and silver (like pyrrhotite or ruby silver), or antimony, sulphur and copper (like tetrahedrite). The oxysulphid kermesite or red antimony and the oxide cerivanite and stibiconite (antimony oxide) are also important minerals. Antimony has few uses in the arts, it enters, however, into a number of very valuable alloys, as type metal powder, Britannia metal, and Babbitt metal, and is used in medicine. Tartar emetic is the tartarate of antimony and potassium. James's powder is a mixture of oxide of antimony and phosphate of lime. — **Antimony vermilion**, a sulphid of antimony suggested but never used as a pigment. — **Argentine flowers of antimony**, the trioxide of antimony. — **Arsenical antimony** See *allomonite*. — **Black antimony**, antimonious sulphid. — **Butter of antimony** See *butter*. — **Ceruse of antimony** See *ceruse*. — **Diaphoretic antimony**, a preparation chiefly consisting of potassium antimoniate, made by exposing the neutral antimoniate to the action of carbonic acid gas, or by decomposing pure antimony with potassium nitrate. II, *n* In *theol.*, one who maintains that Christians are freed from the moral law as set forth in the Old Testament by the new dispensation of grace as set forth in the gospel, an opponent of legalism in morals. Antinomianism has existed in three forms. In the early church as a species of Gnosticism in the doctrine that sin is an incident of the body, and that a regenerate soul cannot sin, later, in the Reformation, as a reaction against the doctrine of good works in the Roman Catholic Church in the antagonistic doctrine that man is saved by faith alone, regardless of his obedience to or disobedience of the moral law as a rule of life. Finally, as a phase of extreme Calvinism in English Puritan theology in the doctrine that the aims of the elect are so transferred to Christ that they become his transgressions and cease to be the transgressions of the actual sinner. The chief exponent of the second form of antinomianism was John Agricola (Germany, 1492-1566) the chief exponent of the third, Tobias (resp. D D) (England, 1600-1642). [Often with a capital]

Originally, the first time or branch of the horns of a deer—2 Any of the principal tines or branches of a deer's horns with a descriptive prefix or epithet (See below)—3 Now, when used absolutely, one of the solid deciduous horns of the *Cervidae*, or deer family, which are periodically shed and renewed, as distinguished from the permanent hollow horns of other ruminants. Antlers are of all shapes and sizes, from the short simple spikes of some species to the enormous branched or palmate antlers of the stag elk, or moose. They are secondary sexual organs developed in connection with the rut and generally only in the male sex, in some *Cervidae*, as reindeer, in both sexes they consist of a modification of true bone and are therefore radically different from the cuticular or epidermal structures (horns) of other ruminants. During growth they are covered with a modified pericardial and epidermal tissue, abounding in blood vessels and fatty outside, this is

the velvet affording a copious supply of blood to the rapidly enlarging osseous tissue. When the antlers are full grown the vascular activity of the velvet ceases, a result mechanically facilitated by the development of the bone or bony part of the beam, which to some extent strangles the blood vessels. The velvet then withers and shrivels, and peels off in shreds, or is rubbed off by the animal. The horns of the American pronghorn are antlers, but much as they are deciduous and grow in the manner just described, but the vascular structure and otherwise like the horns of cattle. In forestry the tines of much branched antlers, as those of the stag, have special names. In the first year the stag has only front protuberances, called *bushes*; in the second, a simple stem or *antler* (called *spike* in the case of American deer). In the third, a longer stem with one branch the *brow antler*. In the fourth, the *beard*, *beak*, or *bay antler*. In the fifth the *antler royal* is acquired after which the ends of the stag's horns become more or less palmate, developing the *crown* or *antler royal*, whence more or fewer points diverge in subsequent years. The total number of points counting all the tines may be ten. The main stem of a branched antler is the *beam*, the branches, exclusive of the more points of the palmated part, are the *tines*. The order of branching is different in different species. In some the division is dichotomous throughout as in the moose (cf of America). In general the tines are oblique to a main beam. The reindeer is remarkable for the great size of the brow antler, which is also usually much larger on one side than on the other. The most palmated antlers are those of the European elk and of the American moose

- *Syn* Indifference, insensibility, impassibility, *Apathy*, *Stoicism*, *Unconcern*, *Phlegm*, *Calmness*, torpor, coldness, coolness, unfeelingness, lethargy, immobility (See list under *indifference*) *Indifference* denotes absence of feeling, passion, or desire toward a particular object as, *indifference* to pain or ridicule. *Apathy* commonly implies a general want of feeling, a complete indifference in regard to anything due to want of interest or attention, as in the case of a depressed or sluggish intellect, or of extreme illness or affliction. *Insensibility* and *impassibility* suggest the lack of capacity for feeling, or an absence of susceptibility, being qualities rather than states of mind. *Indifference* arising from *impassibility* is more particularly to internal, that arising from *insensibility* to external impressions, the former is, moreover, more profound and radical than the latter. *Indifference* may be an entirely proper state under the circumstances. *Insensibility* and *impassibility* are always at least to be pitied, *unconcern* is always and *indifference* some times blame worthy, as cold and selfish. *Stoicism* is a studied suppression of feeling, or the concealment especially of painful feeling by force of will. *Unconcern* is absence of solicitude (See *care*). *Phlegm* is most suggestive of physical temperament. It is a constitutional dullness or sluggishness as an incapability of being aroused by anything. *Calmness* is a tranquillity resulting from the mastery of the will over passions and feelings that perhaps are strong and keen, and hence is always commendable.

With the instinct of long habit he turned and faced the battery of eyes with the same cold *indifference* with which he had for years encountered the half hidden snarls of man.

The *apophism* formulated by Linnaeus in regard to plants. *Quatrefoix, Human Species* (trans.), p. 50.

2 A precept or rule expressed in few words, a detached sentence containing some important truth, as, the *apophisms* of Hippocrates, or of the civil law.

The three ancient commentators on Hippocrates have given the same definition of an *apophism* i. e. 'a succinct saying comprehending a complete statement, or a saying poor in expression, but rich in sentiment.' *Fleming*.

— **Syn.** *Apophism, Axiom, Maxim, Precept, Dictum, Aphorism, Saying, Adage, Proverb, Truism, Byword, Sent.* All concern in expressing a pithy general proposition, usually in one short sentence, but the latter the form the less applicable, do these names become. An *apophism* is a truth, pointedly set forth, relating rather to speculative principles, ethics, or science, than to practical matters, and forming a brief and succinct statement of a doctrine, thus, "Moderation is the silken string running through the pearl chain of all virtues," and "Malignities are cured by nature, not by remedies," are *apophisms*. "Life is short, and art is long," is from the first *apophism* of Hippocrates. An *axiom* is a self-evident truth, and is therefore used as a basis for reasoning. "A straight line is the shortest distance between two points" is one of the *axioms* of mathematics. "The greater is good is to be chosen before the less" is an *axiom* of morals. The number of *axioms* is necessarily limited, of *apophisms*, *maxims*, etc., unlimited. A *maxim* is a truth which while not so definite and necessarily true as an *axiom*, yet equally acceptable to the mind, refers rather to practical than to abstract truth, stating one of the fundamental rules of conduct, civil government, business policy, and the like, as it is a *maxim* that one should risk in speculation no more than he can afford to lose. It suggests a lesson more pointedly and directly than *apophism*, and differs from *precept* in that a *precept* is a direct injunction whereas a *maxim* is a mere statement of a truth from which a *precept* may be deduced. It would be a *precept* to say, "In speculation risk no more than you can afford to lose." A *dictum* is not a *precept*, but an opinion given with authority, as from superior knowledge, as, a *dictum* of the critics, a *dictum* of Carlyle. An *apophism*, in common matters what an *apophism* is in higher, is essentially a terse proposition that makes a vivid impression on the mind, thus, "In the adversity of our best friends we always find something that doth not displease us," this is called by Dean Swift a *maxim*, but is more properly an *apophism*. "Heaven helps those that help themselves," and

"He who fights and runs away
May live to fight another day."
(*Goldsmith*, Art of Poetry).

are *apophisms*. A *saying* is a lower grade of *apophism*, each is likely to be found associated with the name of the author, as, the *apophisms* of Socrates, a *saying* of Poor Richard. Each is a felicitous expression current for its own sake, but deriving additional popularity from the celebrity of its author. "It is in that *saying* true, One soweth, and another reapeth," John iv. 37, "The little and short sayings of wise and excellent men are of great value, like the dust of gold or the least sparks of the diamond," *Tillotson*. *Adage* and *proverb* are habitual sayings, generally of long standing embodying the common sense of mankind on ordinary subjects. The *adage* is often the more venerable by age and the more dignified in its character, as, "Necessity knows no law." A *saying* may easily become an *adage*. *Proverb* as used in the Bible is often a *saying*, as, "Physician, heal thyself," Luke iv. 23, but in the mod-

ern sense proverb often appears in some concrete figurative and homely form as, "Too many cooks spoil the broth", "Every tub must stand on its own bottom". A truism is a truth too obvious to need explanation or proof, it is a word of relative application, what would be a truism to one might be an axiom or an aphorism to another. A byword is a cant term or phrase, in every one's mouth like a proverb, but applied in disparagement. Saw is a contemptuous term for an expression that is more common than wise, or for a trite or foolish saying reiterated to wearisomeness.

Though varying much in design, these ornaments were often very graceful, particularly in Greek examples. A usual form was a sheaf or plume of volutes, variously combined. The *aplustre* rose immediately behind the

steersman, and is often represented as supporting a flag. As a conspicuous part of the ship, it was often removed as a trophy by captors. Also called *apluston*.

About two hours later Arius stood under the *aplustre* of the galle.

Its numerous species are remarkable for the function of secreting a fluid of violet color (due to the presence of iodine), which they discharge when molested. One of the best known is *A. depans*, the depilatory sea hare, so called because it was supposed that the fluid it discharged was capable of removing hair or preventing its growth. Also written *Laplysia*, by an original mistake (Linnaeus, 1767), followed by many writers.

This method of fighting was a tradition in Greece from the heroic age, but in historic times the practice was preserved only in Boeotia and in Athens, particularly as a feature of the Panathenaic procession in the latter state.

In the Theban (Iliad) there are figures to be found resembling in form, attitude, armour, and dress the *apobates*, who leaped on to their chariots in the Panathenaic festival.

apochromatic (ap'ō-krō-mat'ik), *a* [*<* Gr *ἀπόχρωμα*, < *χρῶμα*(-), color, + *-ac*] An epithet descriptive of an improved form of lens devised by Professor Abbe of Jena, constructed of new kinds of glass which allow of a more perfect correction of chromatic and spherical aberration than has hitherto been possible. The kinds of glass employed are chiefly remarkable in that their dispersion for different parts of the spectrum is nearly proportional, hence a lens constructed of them is not subject to the limitation of an ordinary achromatic lens of being strictly achromatic for two colors only. Another defect of ordinary lenses, that their spherical aberration is not corrected for all rays, is also largely overcome.

The elimination of these errors realizes an achromatism of higher order than has hitherto been attained. The objectives of this system may be therefore distinguished from achromatic lenses in the old sense of the word by the term *apochromatic*, and may be called *apochromatic objectives*.

Specifically—2 *Eccl's* (a) A name given in the early church to various writings of uncertain origin and authority, regarded by some as inspired, but rejected by most authorities or believers. Such books were either works acknowledged to be useful and edifying, but not established as canonical, or else heretical writings absolutely rejected by the church. (b) [*cap*] A collection of fourteen books subjoined to the canonical books of the Old Testament in the authorized version of the Bible, as originally issued, but now generally omitted. They do not exist in the Hebrew Bible, but are found with others of the same character scattered through the Septuagint and Vulgate versions of the Old Testament. They are—First and Second Esdras (otherwise Third and Fourth Esdras), Tobit or Tobias, Judith, the Rest of Esther, Wisdom of Solomon, Ecclesiasticus, Baruch (as joined to Jeremiah), parts of Daniel (namely, Song of the Three Children, the History of Susanna, the Destruction of Bel and the Dragon), the Prayer of Manasses, and First and Second Maccabees. Most of these are recognized by the Roman Catholic Church as fully canonical, though theologians of that church often distinguish them as deuterocanonical on the ground that their place in the canon was decided later than that of the other books. Limiting the name *Apocrypha* to the two (last) books of Esdras and the Prayer of Manasses and other books not in the above collection, namely Third and Fourth Maccabees, a book of Inoch, an additional or 151st Psalm of David and thirteen Psalms of Solomon. With these sometimes are included certain pseudepi-

graphic books such as the Apocalypse of Baruch and the Assumption of Moses. The name *Apocrypha* is also occasionally made to embrace the Antilegomena of the New Testament. The Greek Church makes no distinction among the books contained in the Septuagint. In the Anglican and Lutheran churches, the *Apocrypha* are read for example of life and instruction of manners, but not for the establishing of any doctrine. See *antilegomena* and *deuterocanonical*

(a) In the classification of Linnaeus (1758) a group of osseous fishes without ventral fins and comprising a heterogeneous assemblage of representatives of various modern orders. (b) In Bloch and Schneider's system (1801), some of several orders of fishes the name being repeated under several so-called classes which were distinguished by the number of fins. As thus used, the word was a descriptive rather than a distinctive term. (c) In Cuvier's system, a section of the malacocephalus, the name being applied adjectively to such forms as are destitute of ventral fins. The true cels subbranchiate cels, *Gymnodontes*, typical *Ophiodontes*, and *Amniodontes* were referred to this group. (d) By various later writers the name was used as a distinctive ordinal name. By L. Muller the *Ophiodontes* and *Amniodontes* were eliminated. By Gill in 1861, the order was restricted to the typical and subbranchiate cels, and later (1884) to the true cels, or teleost fishes with the intermaxillary apparatus lost, the supra-maxillary lateral, and the body anguilliform and destitute of ventral fins. These characters are correlated with various others which justify the isolation. The principal families are the *Anguillidae*, *Ophichthidae*, and *Muraenidae*

See *apostolic see* — *Apostolic Constitutions*, a collection of diffuse instructions, relating to the duties of clergy and laity, to ecclesiastical discipline, and to ceremonies, divided into eight books. Unlike the apostolic canons, they seem to have been practically unknown in the West until their publication in the sixteenth century, though existing in ancient MSS. in some libraries like the canons, they profess to be the words of the apostles, written down by Clement of Rome. Controversy has existed with regard to their precise age, composition, and authoritative character. They are now generally supposed to be considerably later than the time of the apostles, but to have been in existence, in the main, by the end of the third and the beginning of the fourth century — *Apostolic council*. 2 A proceeding taken to reverse a decision by submitting it to the review of a higher authority as, an *appeal* to the house from a decision of the chair. In *law* (a) Sometimes used in the above general meaning, so as to include writs of error, certiorari, etc. (b) Strictly, the removal of a cause or suit from a lower to a higher tribunal, in order that the latter may revise, and, if it seems needful, reverse or amend, the decision of the former. In modern usage an appeal implies not merely a preliminary objection but a proceeding for review after a decision has been rendered. As now used, it is a proceeding derived from the courts of equity. The mode of review at common law was formerly not to remove the cause, but only to bring up specific points or questions by writs of error. This was changed in England by the Judicature acts of 1874-5, and there is now one court of appeal for all cases. In Scotland the highest appellate court is the Court of Session. The judgments of both these courts may be appealed to the House of Lords. In the United States the appeal has been to a great extent substituted for the writ of error. The highest appellate courts are for federal questions arising in either federal or state courts, the United States Supreme Court. For other questions, the supreme courts, courts of appeal, or courts of error of the various States, the practice being wholly regulated by statutes. (c) The

mode of procedure by which such removal is effected. (d) The right of removal to a higher court. (e) Formerly, a vindictive action at the suit of a party injured when the supposed criminal had been previously acquitted on an indictment or pardoned. The appellant raised an action (which had to be brought within a year) and demanded the punishment of the accused, who had to submit to a fresh trial by jury, or demand a trial by wager of battle. It is well to make a distinction between perception, which is the inner state of the mind, representing external things and *apperception*, which is consciousness, or the reflective knowledge of this interior state, which is not given to all souls, not always to the same soul. *Leibnitz*, *Nature and Grace*, tr. by N. Portier, § 4.

The Leibnitz Wolfians distinguished three acts in the process of representative cognition: (1) The act of representing a (mediate) object to the mind, (2) the representation or to speak more properly, representation, itself as an (immediate or various) object exhibited to the mind (3) the act by which the mind is conscious immediately of the representative object, and through it mediately of the remote object represented. They called the first perception, the last, *apperception*, the second, *Idea*. *Sir W. Hamilton*, *Reid*, p. 877, note.

Value, Price, Esteem, Estimate, Appreciate *Value and estimate* commonly imply a comparison with a standard of commercial worth, as, to value a picture at so much, to estimate its value at so much. To prize is to value highly generally for other than pecuniary reasons, and suggesting the notion of reluctance to lose. Thus, we prize a book for its contents or associations, we prize a friend for his affection for us. To esteem is sometimes simply to think as, I esteem him a scoundrel, sometimes to value as, I esteem it lightly, sometimes to have a high opinion of or set a high value on as, I esteem him for his own sake, in its highest sense it implies moral approbation. Estimating is an act of computation or judgment and wholly without feeling or moral approbation as, to estimate the size of a room, the weight of a stone, the literary excellence of a book, the character of a person (See *esteem*, *n.*, for comparison of corresponding nouns). Appreciate is to set a just value on, it implies the use of wise judgment or delicate perception as, he appreciated the quality of the work. With this perception naturally goes a corresponding intellectual valuation and moral esteem as they know how to appreciate his worth. Appreciate often implies also that the thing appreciated is likely to be overlooked or undervalued. It is commonly used of good things as, I under stood his wickedness, I realized or recognized his folly, I appreciated his virtue or wisdom. Compare such phrases as an appreciative audience a few appreciative words, appreciation of merit.

The pearls after removal from the dead oysters are "classified" by passing through a number of small brass cylinders. Having been sized in this way, they are sorted as to colour, weight, and value.

pubescent, orange-colored fruit, of a rich aromatic flavor, the produce of a tree of the plum kind, *Prunus Armeniaca*, natural order *Rosaceae*. Its specific name is due to the belief that it is a native of Armenia, but it is now supposed to be of Chinese origin.

It grows wild in the Himalayas and Northwestern Provinces of India, where its fruit is gathered in great quantities. It was introduced into England in 1524, by the garden of Henry VIII. The tree rises to the height of from 15 to 20 and even 30 feet, and its flowers appear before its leaves. In cultivation it is often propagated by budding upon plum stocks. There is a considerable number of varieties some of them with sweet kernels which may be eaten like almonds. a priori (ā pri-ō'ri) [*L.*, from something prior or going before *ā* for *ab*, from, *priori*, abl. of *prior*, neut. *prīus*, preceding: see *prior*, *a*] From the former, from that which precedes, hence, from antecedent to consequent, from condition to conditioned, or from cause to effect. Since the fourteenth century, the phrase *demonstratio a priori* (first found in Albert of Saxony, died 1390) has been commonly employed, instead of the earlier *apodictic demonstratio* proper *quid*, to mean proof proceeding from causes or first principles: opposed to *demonstratio a posteriori*, or *de demonstratio quia*, which proceeds from effect to cause, and simply proves the fact without showing why it must be as it is. In the eighteenth century *de demonstratio a priori* was applied to reasoning from a given notion to the conditions which such notion involves. But since Kant, *a priori*, used as an adjective and frequently placed before the noun, has been applied to cognitions which, though they may come to us in experience, have their origin in the nature of the mind, and are independent of experience.

Demonstration is perfect, when it proceeds from the proper cause to the effect, called of the schoolmen, *a priori*. — *Blundeville, Art. of Logick* (1599), vi. 19.

Thus when we argue from the ideas we have of immensity, eternity, necessity, existence, and the like, that such perfections can reside but in one being, and thence conclude that there can be but one supreme God, this is an argument *a priori*. — *Clarke*.

General truths, which at the same time bear the character of an inward necessity, must be independent of experience — clear and certain by themselves. They are therefore called *a priori*, while that which is simply taken from experience is said to be, in ordinary parlance, known *a posteriori* or empirically only.

Kant, Critique of Pure Reason, tr. by Max Müller.

As used in a psychological sense, knowledge *a posteriori* is a synonym for knowledge empirical, or from experience, and, consequently, is adventitious to the mind, as subsequent to and in consequence of, the exercise of its faculties of observation. Knowledge *a priori*, on the contrary, called likewise native, pure, or transcendental knowledge, embraces those principles which, as the condition of the exercise of its faculties of observation and thought, are, consequently, not the result of that exercise. True it is that chronologically considered, our *a priori* is not antecedent to our *a posteriori* knowledge, for the internal conditions of experience can only operate when an object of experience has been presented. — *Sir W. Hamilton*.

sanctuary of any church, particularly if it presents a superficial resemblance to an apse in the stricter sense, in that it is at least approximately semicircular in plan, and vaulted — commonly equivalent to *chevet*, and applied to the altar extremity of a church, even if of rectangular plan and not vaulted, and including the apse-aisles, chapels, and any other adjunct to the ritual east end of a church. The apse in its origin was a characteristic feature of the ancient Roman basilica, in which it formed the raised tribunal for the court magistrates. The throne of the quæstor or presiding judge stood in the center of the choir of the apse. When the basilicas became Christian churches, the throne was replaced by the high altar, which still occupies this position in Latin churches of the strict basilica type, and has regularly kept it in Oriental churches. Some types of church regularly have secondary apses in other positions than at the eastern end, as at the western end, at the extremities of the transepts or of aisles, etc. See cuts under *basilica* and *tema*. More particularly applied to structures of masonry and tunnelling for the conducting of water from distant sources to large cities through tubular conduits. Aqueducts were extensively used in the Roman empire, and many of these ancient structures still remain. They were constructed of stone or wood, sometimes tunneled through hills and carried over valleys and rivers on arches much of the labor upon them being uselessly expended from a mistaken idea of the necessity of a perfectly level course. The aqueduct of Segovia, originally built by the Romans, has 160 arches. It is in some parts built in two tiers 100 feet or more in height, and is an admirable monument of ancient engineering. One of the most remarkable aqueducts of modern times is that of Marseilles, to which city it conveys the waters of the river Durance from a distance of about 55 miles, of which 10 miles consists of tunnels, and a considerable portion is traversed by means of viaducts of great height and length. This aqueduct was built between 1839 and 1847, and supplies water in such abundance that the environs of Marseilles, formerly

of birds established by Brisson in 1760, but having no characters by which it can be exactly defined. The name has been loosely applied to eagles and other large diurnal raptorial birds which have no tooth of the beak. It is now restricted and somewhat definitely applied to eagles having hooked talon, that is, having the shank more or less completely feathered. Such are the golden eagle, *A. chrysaetos* of Europe and North America, the spotted eagle *A. nebulosa*, of Asia and Europe, the imperial eagle, *A. heliaca*, of the same region, the Russian eagle, *A. moussulensis*. See cut under eagle.

der *Ranunculacea*, widely distributed over the temperate parts of the northern hemisphere. The flowers have five flat elliptical, colored sepals, alternating with as many spurred petals, the fruit consists of five follicles with numerous seeds. The spurred petals with incurved heads have been compared to five pigeons, the sepals representing the wings, and to this the English name *columbine* refers (from Latin *columba*, a pigeon). Several species are common in cultivation, and, as they are prone to sport and hybridize, the varieties of form and color are numerous. There are 10 North American species in some of which, from the Rocky Mountains and Mexico, the spurs are several inches in length.

It afterward became the Frankish and French duchy (and for some time kingdom) of Aquitaine (held as an appanage of the English crown through intermarriage for about 300 years before 1453) and finally, greatly reduced, the French province of Guienne (a medieval corruption of *Aquitania*).

It has two working chambers into which steam is alternately admitted. By the condensation of the steam a partial vacuum is formed to fill which water rushes in. When the chamber is full of water a valve opens, and steam enters and forces the water out into a pressure or delivery chamber. The steam condenses as before, causing the inflow of a further supply of water. One chamber is filling while its companion is discharging, thus keeping up a continuous delivery. II n 1 A kind of ornament of a capricious and fanciful character, consisting of lines, geometrical figures, fruits, flowers, foliage, etc., variously combined and grouped, and painted, inlaid, or wrought in low relief used especially for the decoration of walls and ceilings, but also for the decoration of objects of any nature. In the arabesque of the Mohammedans animal forms were rigidly excluded, in accordance with the requirements of their religious law, but the Greeks and Romans, and the Renaissance artists, among them Raphael and his scholars, to whom are due the rich arabesque decorations of the loggia of the Vatican, had all the kingdoms of nature under contribution. The Greeks undoubtedly derived the idea of pictorial or plastic ornament of this kind from the Oriental stuffs, painted, woven, or embroidered with natural or fabulous forms of plants and animals, which were brought to them by Phœnician traders from a very early period.

II n 1 A native of Arabia, an Arab. **2** One of a Christian sect of the third century (commonly called *fraticelli*) which sprang up in Persia, beyond the Jordan, a region often included in Arabia. According to Eusebius, its members asserted that the human soul, as long as the present state of the world existed, perished with the body, but that it would be raised again with the body at the time of the resurrection. The point was discussed with them by Origen, at a council with so much force that they were led to change their opinions.

styles of architecture, but applied especially to Egyptian and Oriental examples. This architecture shows in its systems of construction and ornament the profound influence of Persian and Byzantine models, though, as a rule, in architectural science it falls far behind the work of the Byzantine masters. The ovoidoconical dome supported on pendentives is a characteristic feature, the buildings are usually square or polygonal in plan, seldom circular, the roofs are in general flat, and supported by arches resting on columns forming long parallel aisles, and often surrounding a central court. The arches are very commonly of the horseshoe shape developed in Persia, and from the beginning show the pointed form, though it is clear that neither form was adopted for constructive reasons, and that neither influenced the methods of building, much less revolutionized the entire art of architecture, as did the adoption of the pointed arch in western Europe. Walls, particularly interior walls, ceilings, domes, spandrels, etc., are commonly covered with an intricate lacework of arabesques, usually executed in relief on stucco, and often colored with at once great brilliancy and great delicacy. The most noteworthy examples of the style exist in Cairo—**Arabic figures or characters**, the numeral characters 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, so called as having been introduced into European from Arabic use. They were so introduced in the twelfth century, and the work of Leonardo da Vinci, published in 1502, contributed much to their dissemination. They were taken from the Arabic work of Al Khwarizmi (see *algorism*), who obtained them in India or Afghanistan. The system in its complete form (with the cipher) certainly originated in India, but what the ultimate origin of the characters was, whether they had been previously known in Europe without the cipher, and their history among the Arabians, are matters still in dispute.

II. n The language of the Arabians, a Semitic dialect, belonging (along with the Ethiopic and Abyssinian languages) to the southern branch of the Semitic family, and generally regarded as exhibiting more ancient features than any other Semitic tongue. It is the language of the Koran, the sacred language of Islam, and possesses an immense literature, almost wholly Moslem and later than the time of Mohammed. Many other languages have borrowed largely of its material, from the Persian, Turkish, Hindu, Malay, and Malay on the east to the Spanish on the west.

Araceae (a-rā-sē-ā), *n pl* [*NL, < Arum + -aceae*] A natural order of monocotyledonous plants, of which the genus *Arum* is the type.

The species are herbaceous perennials, mostly aculeate, from tuberoses or creeping roots, but in the tropics often tall rooting climbers. The inflorescences are usually monocious or dioecious, are crowded upon a spadix surrounded by a spathe, with which it is sometimes confluent. The order includes 98 genera and about 1,000 species, abundant within the tropics, but comparatively rare in temperate regions. The larger genera are *Anthurium*, *Philodendron*, *Arum*, *Arisaema*, and *Pothos*. In temperate North America there are 10 species, belonging to 8 genera, of which the most common is the Jack-in-the-pulpit, or Indian turnip, *Arisaema triphyllum*. The skunk cabbage, *Symplocarpus foetidus*, and the sweet flag, *Acorus calamus*, are also well known representatives of the order. The tuberous roots of many species abound in starch and furnish a wholesome food when cooked, or after the acidity has been removed by washing, as in the taro, *Colocasia antiquorum*, which is extensively cultivated in tropical countries. British or Portland arrowroot is manufactured from the roots of *Arum maculatum* (the wake robin or cuckoo pint), the species of which are natives chiefly of tropical countries. A principle of acidity generally pervades the *Araceae*, existing in so strong a degree in some as to render them dangerous poisons as *Dioscorea*, *Scilla*, *Veratrum*, of the West Indies and South America, which receives its popular name *dumb cane* from the fact that when it is chewed the tongue becomes swelled by the acrid juice, and the power of speech is destroyed. Many species are cultivated in greenhouses, chiefly as foliage plants, and

The ginseng of North America, *Aralia nudicaulis*, is less valued. A species of *Aralia*, *A. nudicaulis*, is used in North America as a substitute for sarsaparilla.

Aramides (a-rām'ī-dē), *n* pl [**< Aramus** + *-ides*] A family of gallinaceous birds, confined to the warmer parts of America, and forming a connecting link between the cranes and the rails, or the gruiform and ralliform birds. The principal osteological and pterylographic characters are those of the crane, while the digestive system and the general habits and appearance are those of the rails. There are a pair of coxae, a pair of coracoid bones, and a pair of scapulae, and muscles. The family consists of the single genus *Aramides* (which see).

Aramides (a-rām'ī-dē), *n* [**< Aramus** + *-ides*] A genus of American ralliform birds, of the family *Rallidae* and subfamily *Rallinae*, the American cranes, or small rails with short bills. The genus contains about 20 species, chiefly of Central and South America. It is sometimes restricted to one group of these, other names as *Porzana*, *Columbopsis*, and *Circus*, being used for the rest.

They are about 2 feet long, of chocolate brown color streaked with white, with short and rounded wings, a pale throat primus, a short tail of 12 feathers, and clef toes. The hind toe is elevated and the tarsus is scutellate anteriorly and as long as the bill. The bill is twice as long as the head slender but strong compressed, contracts opposite the line at nostrils, grooved about half its length and enlarged and decurved in the terminal portion. *A. pictus* (once) inhabits Florida where it is known as the limpkin, another species *A. scolopaceus*, the scolopaceous coulian, is found in the warmer parts of America. By various restrictions it has been reduced to the value of one of the modern families or genera of spiders, and has been eliminated entirely from some systems. *Araucaria domestica* the common house spider is now *Erigonina domestica*. Also *Araucaria*.

Araucaria (ar-a-nē'ā), *n* pl [**< NL**, **< Aranea** + *-aria*] A superfamily and subgroup of the class *Arachnida*, now usually called an order, containing the spiders as distinguished from the mites, scorpions, and other arachnidans.

practically synonymous and conterminous with *Imeronomata* or *Pulmotrachearia*. The spiders breathe by two or more pulmonary sacs, combined or not with tracheae. The abdomen is not segmented, and is distinctly separated from the cephalothorax, they have no antennae, as such, but a pair of palps, they have from 2 to 8 simple eyes, and 8 legs of 7 joints each. The abdominal appendages are modified into an arachnidium or spinneret, the apparatus by which (cobweb, gossamer, and other kinds of spider silk are spun from a secretion of glandular organs. There are also always poison glands connected with the mouth parts. The division of the group varies with (ever) leading, will be as to number of suborders or families and their arrangement, some admitting but two or three families, others several suborders and upward of twenty families, while the diversities of detail are endless. A prime division is into *Diplomones*, those having two pulmonary sacs (the great bulk of the order), and *Tetratopmones*, with four, or according to the number of stigmata, those having two pairs (*Tetratopmones*) or only one pair (*Trichopoda*) or according to the number of eyes, whether 2, 4, 6, or 8, or, finally, according to the way in which they move about and spin their webs. Some authors adopt three families *Araucaria*, *Lycosidae*, and *Mygalidae*. Also *Araucaria*, *Araucaria*.

Mygalis comantaria typical of *Araucaria*. 1 female natural size. *At* thellicere. *II* pedipalp. *III* maxillary feet. *IV* *V* *VI* thoracic feet. *Ch* cephalothorax. *B* last joint of pedipalpus of male much in length. See cut under *Cheliceræ*.

Araucaria (ar-a-nē'ā-dē), *n* pl [**< Aranea** + *-aria*] The spiders, considered as a family, the spinning spiders. The group approaches more or less nearly in extent the order *Araucaria*. In some systems the term disappears, being conterminous with the order, which then is divided into numerous families of other names.

They are sometimes placed with the *Crustacea* in an order or a sub class called *Podomomata*, sometimes in *Arachnida* sometimes combined with the *Arachnida* in a subclass *Pseudarachnida*, and sometimes otherwise disposed of. They have a rudimentary unsegmented abdomen, a subtorial mouth, and 4 pairs of long, jointed legs, but are destitute of respiratory organs. Some are parasitic.

A crossbow used in Europe in the chase and in war throughout the middle ages. The bow was made of steel, horn, or other material, and was of such great strength and stiffness that some mechanical appliance was used to bend it and adjust the string to the notch. The lighter *arbalists*, used in the chase and generally by horsemen, required a double hook which the *arbalist* carried at his side. Heavier ones required a kind of lever, or a wheel, or a revolving wheel with a ratchet and long handle, to draw them; these appliances were separate from the *arbalist*, and were carried slung from the shoulder or at the belt. The short and heavy arrow of the *arbalist* was called a *quarrel*, from its square head, or more commonly a *bolt*, as distinguished from the shaft discharged by the longbow. Sometimes stones (see *stone bow*) and leaden balls were used. The missile of the *arbalist* was discharged with such force as to penetrate ordinary armor, and the weapon was considered so deadly as to be prohibited by a council of the church except in warfare against infidels. It could, however, be discharged only twice a minute. It was used especially in the attack and defense of fortified places. For similar weapons of other periods than the European middle ages, see *crossbow*. Also *arballist*, and formerly *arblast*.

The final *arbitrator* of institutions is always the conception of right prevailing at the time. *Rae*, *Contemporary Socialism*, p. 179.

arbitration (ar-bi-trā'shon), *n* [*ME arbitracio*, *< OF arbitracio* = *Pr arbitracio*, *< L arbitracio* (*n*), *< arbitracio*, *arbitrate*, *judge* see *arbitrate*] The hearing and determining of a cause between parties in controversy by a person or persons chosen or agreed to by the parties. Frequently two are nominated, one by each party the two being authorized in turn to agree upon a third who is called the umpire (or, in Scotland sometimes the *overman*) and who either acts with them or is called on to decide in case the primary arbitrators differ. The determination of arbitrators or umpires is called an *award*. By the common law an award properly made is binding but the arbitrators' authority may be revoked before award at the will of either party. Permanent boards of arbitration are sometimes constituted by legislative or corporate authority but the submission of cases to their decision is always voluntary

the Roman emperors, and were originally temporary structures, festooned and otherwise decorated, standing at the entrance of a city, or in a street, that a victorious general and his army might pass under them in triumph. At a later period the triumphal arch became a richly sculptured, massive, and permanent structure, having an archway passing through it, and often a smaller arch on either side The name is at the present day often given to an arch, generally of wood decorated with flowers, evergreens, banners, etc., erected on the occasion of some public celebration or rejoicing The great arch in a church which gives access to the choir — the chancel arch — is sometimes so called In early Christian churches, a representation of the Glory or Triumph of Christ sometimes occupied a wall space above this arch.

It also includes an undetermined portion of the rocks formerly designated as *primitive*, and by some writers is vaguely used to indicate crystalline rocks of uncertain and often quite recent age. Archæology is sometimes taken specifically in the restricted sense of the science of ancient art, including architecture, sculpture, painting, ceramics, and decoration, together with whatever records may accompany and serve to identify them. — **Classical archæology**, the archæology of ancient Greece and Rome. — **Medieval archæology**, the archæology of the middle ages. — **Syn. It is of Jurassic age, and is notable as the oldest known avian type, and

as combining some characters of a lizard with those of a bird. The original fossil consisted only of the impression of a single feather, upon which the name *Archæopteryx*

lithographica was imposed by Von Meyer. A second specimen from the same formation and locality was named *A. maerula* by Owen. The specific identity of the two can be neither affirmed nor denied, and their generic identity is only presumptive. A third and still more characteristic specimen is identical with the second and has furnished many additional characters. Members of this genus had to the long lizard-like tail formed of many vertebrae and separate metacarpal bones in combination with a cartilaginous sternum and other features of modern birds. It is thus a unique type of ornithic structure and represents a distinct subclass of *Archæopteryx*. See *Saurura*.

In *bot.*, having a primitive blastopore or original orifice of invagination of a blastosphere which has undergone gastrulation, retaining an archenteric aperture, as distinguished from any other which may be acquired by a deuterostomatous gastrula. It is the usual state of those gastrulae which are formed by emboly.

In the former [process of gastrulation by emboly] the blastopore would be left as the aperture of communication of the endoderm with the exterior, and the result would be the formation of an *archæostomatous gastrula*. Huxley, *Anat. Invert.*, p. 685.

archæus (ar'kē'us), *n*, pl *archæi* (-ī) [NL, < Gr *αρχαιος*, ancient, primitive, < *αρχη*, beginning, < *ἀρχην*, be first see *archæo-*] In the philosophy of Paracelsus and other spagyrics, mystics, and theosophists, a spirit, or invisible man or animal of ethereal substance, the counterpart of the visible body, within which it resides and to which it imparts life, strength, and the power of assimilating food. The word is said to have been used by Basil Valentine, a German chemist of the fifteenth century, to denote the solar heat as the source of the life of plants. Paracelsus uses it with the above meaning. It is frequent in the writings of Van Helmont, who explains it as a material preexistence of the human or animal form *in posse*. He regards the archæus as a fluid that is as a semi-material substance like air, and seems to consider it a chemical constituent of the blood. Paracelsus had particularly made use of the hypothesis of the archæus to explain the assimilation of food. This function of the archæus became prominent in medicine. Van Helmont calls it the door-keeper of the stomach (*janitor stomachi*). There are further diversifications of meaning. Also spelled *archeus*.

As for the many pretended intricacies in the instance of the efformation of Wasps out of the Carcase of a Horse, I say, the *Archei* that formed them are no parts of the

Horse's Soul that is dead, but several distinct *Archei* that do as naturally join with the Matter of his body, so putrefied and prepared, as the Crows come to eat his flesh. Dr H. More, *Antidote against Atheism*, app. xi.

A person familiar with the dialect of certain portions of Massachusetts will not fail to recognize in ordinary discourse many words now noted in English vocabularies as *archaic*, the greater part of which were in common use about the time of the King James translation of the Bible. There is in the best archaic coin work of the Greeks a strength and a delicacy which are often wanting in the fully developed art of a later age. Head, *Historia Numorum*, [Int., ix].

The archaic, in art, not simply the quality of rudeness or of being primitive, but a rudeness and imperfection implying the promise of future advance. Work that is merely barbarous is not properly archaic. The archaic style in art of sufficient force to have any development, succeeds the first rude attempts of a people to arrive at graphic representation, and exhibits a manifest sincerity and striving to attain truth until finally the archaic quality disappears little by little as truth is reached in the great art schools such as those of Greece and of the Renaissance painters or as art sinks into lifeless conventionalism before reaching truth, as in the sculpture of Egypt and Mesopotamia.

The word occurs in two passages of the Bible, 1. Luke iv 10, and Jude 9. Michael, mentioned in the latter as an archangel, also in Daniel as the spiritual prince of the Jews, and in Rev. xii 7 as the leader of the heavenly hosts against the dragon and his angels, is the 4th Michael of the church calendar. Coming after him in dignity, three others are especially known by name as archangels: Gabriel, the heavenly interpreter and announcer; Michael, the heavenly interpreter and announcer; and Uriel (2. Luke iv 10), the fire of light of God, often mentioned, like the others in Milton's "Paradise Lost." Three other names are added by tradition to make the number seven (Tobit xii 15, Rev. viii 2, where the angels mentioned are taken as archangels) Chamael, Jophiel or Zophiel, and Zadkiel, and still others are spoken of.

For archangels were the first and most glorious of the whole creation: they were the morning work of God, and had the first impressions of his image.

Druid, Dec. of Plutarch's Lives

2 A member of the lowest but one of the nine orders of angels composing the "celestial hierarchy" of Dionysius the pseudo-Areopagite, whose classification was adopted by Pope Gregory the Great, and is generally accepted by the theologians of the Roman Catholic Church. The nine orders are seraphim, cherubim, thrones, dominations, virtues, powers, principalities, archangels, angels.

The bird breeds very true, the chief points being the peaked crest and the luster.

archbishop (ärch'bish'up), *n* [*< ME. archbishop, archbischof, etc. < AS. arce-, arce-, archescop (also h. d. h. biscop, lit. high bishop) = (Fries. archbischof = D. aartsbischof = OHG. erzbischof, G. erzbischof = Icel. erkbisкуп = Dan. It was also occasionally applied in the East to exarchs and metropolitans of sees of exceptional antiquity or dignity, and was sometimes extended in later times to others of the same rank as a special distinction. In the West, from the eighth or ninth century, the title was given to metropolitans of every class, and this is still the use of the Roman Catholic Church. Archbishops have certain rights of honor and jurisdiction over their suffragan bishops (that is, the bishops of the dioceses making up their ecclesiastical province), such as those of calling and presiding over provincial councils, receiving appeals in certain cases, etc. but these rights, formerly very considerable, are now comparatively limited. At present the archbishop is not always a metropolitan, since there have long been a few archbishops without suffragans, and often still the title is purely honorary. See *primate*. The insignia of an archbishop in the Roman Catholic Church are the wooden pallium, before receiving which from the pope he cannot exercise the functions of his office, and the double cross borne processionally before him. In the Anglican Church there are four archbishops, two in the Church of England (those of Canterbury and York, the former of whom is metropolitan of all England), and two in the Church of Ireland (those of Armagh and Dublin, the former of whom is primate). The Church of Sweden has one archbishop, whose see is at Upsala. Abbreviated to *abp*.

The word is found as the title of an ecclesiastical dignitary from the fourth century. In the East it is last found as applied to an ecclesiastical officer of the court of Constantinople under the late Byzantine empire. In the West, from the eighth century, dioceses began to be divided into separate territories, over which rural archdeacons were placed, having under them deans or rural archpriests, charged with the supervision of the parish priests of their respective districts, over these was the general or grand archdeacon of the whole diocese, who took precedence of the archpriest (which see), and held his own court with its officials, distinct from that of the bishop so that appeals were taken from the former to the latter. The rural archdeacons were often priests, having a cure of souls, and was also the grand archdeacon from the twelfth century. The powers and privileges of this office were gradually restricted and in the Roman Catholic Church, since the Council of Trent, its place is for the most part supplied by the bishop's vicar general, between whom and the parish priests are some times found the vicars forane, or present rural deans, while the archdeacon of the present day, where the office survives, holds a dignity of honor. In the Church of England each bishop has the assistance of two or more archdeacons who as his deputies inspect and manage the affairs of the diocese, and perform a variety of duties partly secular and partly ecclesiastical. In two dioceses of the Protestant Episcopal Church of America the title *archdeacon* has been introduced — *Archdeacon's court*. See *court*

In Russia the bishops are selected from among the archimandrites. The title has been retained among those who separated from the Eastern Church and submitted to the pope while still observing the Greek rite (the so-called United Greeks) and then monasteries are now subject to one proto archimandrite. A congregation of Basilian monks existing in Sicily before the eleventh century has been under the care of an archimandrite apparently from that time. Its head abbey is that of San Salvatore. In Messina and it forms an exempt archimandrite immediately dependent on the pope. In the early church, and sometimes during the middle ages in the Western Church, the word was used vaguely as equivalent to *prioste*.

C., or to his mechanical inventions. **Archimedean drill** See *drill*. — **Archimedean principle**, or **principle of Archimedes** (a) The principle of the equilibrium of the lever, namely, that a lever loaded with two weights, on opposite sides of the fulcrum, is in equilibrium when the weights are inversely proportional to the length of the arms at which ends they hang, and that the pressure on the fulcrum is the sum of the two weights. (b) The hydrostatic principle also discovered by Archimedes, that a body immersed in a fluid loses an amount of weight equal to that of the fluid it displaces. — **Archimedean propeller**, a propeller consisting of a continuous spiral vane on a hollow core running lengthwise of the vessel. It is an amplification and extension of the screw. — **Archimedean railway**, a form of railway in which a continuous shaft rotates on pillars between the lines of rails, and propels the car by means of a screw which engages in a pedestal attached to the car. — **Archimedean screw**, a device for raising water, said to

Archimede in Screw

have been invented by Archimedes. It is made by forming a spiral tube, within or by winding a flexible tube spirally about a cylinder. When the cylinder is placed in an inclined position, and the lower end is immersed in water, its revolution will cause the water to move upward through the spiral chamber. Whatever quantity of water first enters the screw immediately descends by its own weight to the lower end of the spiral, but this point is always shifted higher up by the revolution of the screw, the water may thus be raised to a considerable height. Also called *water screw* and *spiral pump*. — **Archimedean solid**, one of the thirteen solids described by Archimedes, which, without being regular, have all their solid angles alike, all their faces regular, and not less than four faces of any one kind. Sometimes incorrectly called *semiregular solids*. They are the truncated tetrahedron, the cuboctahedron, the truncated octahedron, the truncated cube, the rhombicuboctahedron, the truncated cuboctahedron, the runcuboctahedron, the truncated dodecahedron, the snub cube, the rhombicuboctahedron, the truncated rhombicuboctahedron, and the snub dodecahedron. The Architect cannot fail to remark how severe, in a true age of art, is the observance of this great *Architectonic* law—how its influence pervades all design—how the pictures on Greek vases, or the richly embossed and chased work of the mediaeval goldsmiths, are all adjusted to the form and surface allotted to them by an external necessity. *C. Architecture includes, in the widest sense, (1) the principles of design and of ornament as applied to building, (2) the science of construction, including the properties of materials and the methods of combining them, and (3) the practice of construction including estimates of cost and the directing of builders and workmen. The practice of this art requires skill in design, which is the special province of the architect, and skill in execution, which is the special province of the workmen whom the architect employs and directs. It is the function of skill in architectural design to combine in a harmonious scheme the independent and often hostile requirements (1) of use

and convenience as dictated by the conditions of the problem in hand, (2) of constructive necessity and fitness as determined either by practical experience or by scientific theory, and (3) of artistic excellence both in the proportions of the parts and in the decorative treatment of details, in accordance with either the general principles and canons of good taste or the prescriptions of custom or tradition. It is the function of skill in execution practically to carry out the scheme so designed, and this skill is exercised by draftsmen, surveyors, mechanics, artisans, and artists, each in his place. Architecture is properly distinguished from mere building by the presence of the decorative or artistic element. The most important styles in the history of architecture are the Egyptian, Assyrian, Hellenic, Roman, Byzantine, Medieval (including Romanesque and Gothic), Renaissance, and Arabic (See these and other adjectives characterizing architectural styles). The various later medieval styles are commonly included under the vague and misleading term Gothic (which see).

Architecture, the art of building, includes two elements, theory and practice. The former comprehends the fine art side proper, the body of general rules inspired by taste and based on tradition and the science which admits of demonstration by means of invariable and absolute formulas. Practice is the application of theory to particular needs, it is practice which causes the art and the science to conform to the nature of materials, to climate, to the customs of a period, or to the necessities of the occasion.

Vollet le Duc, Dict. de l'Architecture (trans.), I, 116.

We must consider *Architecture* as the great law which has in all time regulated the growth and affected the form of painting and sculpture, till they attain to a certain period in their development, and free themselves from its influence. (*P. Newton, Art and Architect.*) p. 29.

After the abolition of the title of king in Attica there was chosen a single archon who exercised for life essentially royal prerogatives. The term of office was afterward reduced to ten years, and in 683 B. C. it was made annual, and the duties of the archonship were distributed among nine persons. The first was the *archon eponymos* (name giving archon), whose functions were executive and judicial, and whose name was given in official acts, etc., to the year of his service; the second was the *archon basileus* (archon king), whose duties were chiefly religious and ceremonial; the third was the *archon polemarchus* (archon generalissimo), who was, first in fact and then nominally, commander of the military power, and the remaining six were the *thesmothetes*, or administrators of justice, whose most important duty it was to pass carefully in review, each year, the whole body of laws of the state, in order to make sure that no errors or contradictions had crept in, that repealed laws had been duly canceled, and that repetition was avoided. It rested with the thesmothetes, also, to see that all the laws of the republic that were in vigor were strictly enforced, and to bring to trial any public official who had failed in his trust. At the end of his year of office, all the archons, unless they were found guilty of malfeasance, by virtue of their office entered the council of the Areopagus.

As a title it dates from the fourth century, and was originally given to the senior by ordination in a diocese, a rule long strictly observed in the West. The archpriest or dean of the cathedral assisted the bishop in solemn functions and in his spiritual administration, though without ordinary jurisdiction, the rural archpriest or dean had a limited superintendence over the parish priests of his deanery or district of the diocese, and formed with them the rural chapter, as the bishop with his canons formed the cathedral chapter. For relations with other officials, see *archidiacon*. At present, in the Roman Catholic Church, *archpriest* is, for the most part, a title of honor only, the former duties of the office being performed by the auxiliary bishop or the dean of the cathedral chapter. The duties of the rural archpriests, since the Council of Trent, have commonly devolved on the vicars forane, still sometimes called rural deans, or directly on the bishop's vicar general. In the rare case when rural archpriests and vicars forane are found in the same diocese, the latter have the precedence.

Though modified several times in its constitution, notably by Solon and Ephialtes the Areopagus always retained the highest reputation for dignity, justice and wisdom. Its functions were at once religious, political and judicial. The scope of its action was thus much wider than that of a supreme court of the present day, extending not only to jurisdiction in cases of homicide and some others in which religion was concerned and to a general censorship of all affairs of state but even to the supervision of education, and to cer-

They are still used, especially in France, as the common names of these six notes. Since the intervals between these notes are the same as those between the first six tones of the modern major scale, the syllables have also been used extensively as names for those tones and as guides in studying their relations. This application is called *solmization*. When this used *ut* is generally changed to *do*, and the syllable *so* (tonic *sol fa, &c.*) is added for the seventh tone.

= *Syn* *Argue*, *Dispute*, *Debate*, *Discuss* plead expostulate, remonstrate. To argue is to defend one's opinion or to exhibit reasons or proofs in favor of some assertion or principle. It implies a process of detailed proof by one or more persons. To dispute may be to call in question the statements or arguments of an opposing party as, to

dispute about an award. It often means the alternate giving of reasons, especially by two persons. It is often applied to mere bickering and is in general less dignified than the other words. To debate is to interchange arguments in a somewhat formal manner, as in debating societies and legislative bodies. To discuss is, by derivation, to shake or knock a subject to pieces in order to find the truth, or the best thing to be done. A debate, therefore, may be viewed as a discussion or a discussion as a debate. Strictly, a discussion is an amicable presentation of opinions, not limited, like the others, to affirmative and negative sides of a proposition, and with the expectation on the part of all that the conclusion will be the adoption of no one person's opinion or plan unmodified. To argue a point, to dispute a position, to dispute with a neighbor, to debate a motion, to discuss a subject or a plan

[Thus the familiar meaning of the word probably originated in Roman law courts. The usual definition given by Cicero and almost all authorities is *ratio reddenda facinus plem*, a reason causing belief of a doubtful matter. Hence in one place it thus it as a medium proving a conclusion. The word *medium* here means a premise or premises, according to all the commentators (*Petrus Hispanus*, tr v ad ult.) But since *medium* usually means the middle term of a syllogism some logicians have been led to give *argument* this signification.]

2 The middle term of a syllogism [See preceding note]

Argument is the bare proof or mean term which is invented by him that disputeth, to prove the truth of the question. But *argumentation* is the whole reasoning itself, of what form so ever it be, comprehending both the question and also the proof thereof. *Blundeville*, 1619

8 In *math* (a) Of an imaginary quantity, the coefficient of the imaginary unit in its logarithm. (b) The angle or quantity on which a series of numbers in a numerical table depends and with which the table is entered. If, for example, a table of the sun's declination were formed corresponding to every degree, etc., of longitude, so that the longitude being known the declination might be found opposite to it, then the longitude would be called the argument of the table. Tables of double entry have two arguments. In the Ptolemaic astronomy, the argument, without qualification, is the angular distance on the epicycle of a planet from the true apocenter of the epicycle, and the equation of the argument is the angular distance, as seen from the earth, of a planet from the center of the epicycle, the correction to the second inequality. The flowers are usually of a dingy hue.

Aristotelian logic (a) The logic of Aristotle, especially in the modified form taught in the middle ages. (b) Formal logic, based on the four propositional forms. All S is P. No S is P. Some S is P. Some S is not P. **Aristotelian sorites**, a progressive chain of reasoning like the following. He who is prudent is temperate. He who is temperate is constant. He who is constant is unperturbed. He who is unperturbed is without sorrow. He who is without sorrow is happy. Therefore the prudent man is happy.

The progressive *sorites* has been called the common of *Aristotelian*. This latter denomination is an error. For Aristotle, though certainly not ignorant of the process of reasoning now called *sorites*, does not enter upon its consideration. See *W. Hamilton*.

II, *n* A follower of Aristotle. See *peripatetic*.

Aristotelianism (ar-is-to-tē-lō'an-izm), *n* [*L* *Aristotelianus* + *-ism*] The philosophy of Aristotle, or any later modification of it. Aristotelianism is a kind of metaphysical evolutionism. Its central idea is the distinction of *act* and *potency* (actuality and potentiality). The nature of the world as a whole as well as every part of it, may be illustrated by the analogy of the growth of a tree from a seed. The tree has a sort of being in the seed — a potential being — it exists in *potency* only. That which is actualized in the perfected development from the seed, the tree, exists in *act* or actuality. This perfected development, the entelechy, is the characteristic nature of the thing, which places it in some natural species and which is its *form*, or that element of the thing, which makes it to be the kind of thing that it is. The other element which merely makes the thing to be is its *matter*, which as unformed is identified by Aristotle with the *potency* or potentiality of a germ. Every event is an act of development. Most events take place under the influence of an external efficient cause, and their character is determined by an end. *Matter*, *form*, *effect*, *cause*, and *end* are the four Aristotelian causes or principles. But not all events are brought about by external efficient causes. Some happen by fortuitous spontaneity and are not determined by any causes what ever. Other events come to pass naturally that is by a self-determined growth. Besides that which is moved but does not cause motion and that which is both moved and causes motion there must needs be a *tertium quid*, which is not moved, yet causes motion, and this is God or *pure act* (actuality) without undeveloped potentiality. The soul is the entelechy or perfect flower of the body. It has three parts: the vegetative (or merely vital) the sensible, and the rational. The reason is not a mere belonging of the individual. It exists before the body and, as the active reason, is common to all persons upon the tablets of whose passive reason it writes its dicta. Space and time are mere logical elements of motion. Aristotle is justly called the father of logic, although there were some vague

logical doctrines before him and although his system is now largely superseded. He holds the only excellent reasoning to be syllogism, and all other kinds of reasoning to be imperfect approximations to syllogism. Particular facts are first and best known to us, but general truths are first and best known in themselves. Science must set out with certain fixed first principles, which are definitions. Knowledge is a development from impressions of sense, to the formation of which reason and experience both contribute. Things are of ten classes: substances, relations, quantities, qualities, etc. See *categories*. Different genera are subdivided upon different principles, so that there are no cross divisions in the real classification of nature. It is possible to so collate passages from Aristotle as to make him appear as an inductive logician, but the whole cast of his mind was such as to lead him to underrate the importance of induction. He lays much stress on the principle of excluded middle, which he treats as a corollary of the principle of contradiction, and he has a general leaning to hard and rather wooden distinctions. The most important of his ethical doctrines are that happiness lies in the working out of one's inwardness, and that every virtue is a golden mean between two vices.

arithmetico-geometrical (ar-ith-met'i-kō-jē-ō-met'ri-kal), *a* Arithmetical and geometrical, a term descriptive of a kind of mean between two quantities obtained by taking both the arithmetical and the geometrical means of the quantities, then the means of these means, and so on, until the two results become identical. Thus starting with 2 and 3, we obtain successively the following pairs of means

	Arithmetical	Geometrical
First pair,	2.5	2.449490
Second "	2.474745	2.474815
Third "	2.474680	2.474680

The numbers of the last pair being sensibly equal, 2.474680 is the arithmetico-geometrical mean of 2 and 3. This process invented by Gauss, is useful in calculating elliptic integrals.

pl. In bot., anything that serves as a defense to a plant, as prickles, thorns, or spines — **6** *pl. In falconry*, the legs of a hawk from the thigh to the foot — **7** *pl* The heralric bearings of an individual or a community, consisting of some device in heralric tinctures (see *tincture*) borne on a shield, generally with the addition of a crest and sometimes with supporters. A description in heralric terms of shield, crest, etc., is called *blazoning* (which see). The right to bear the arms of the father is inherited by the sons, but in strictness each of the younger sons should add to the paternal shield a label as a mark of cadency, the same right descends to a daughter only if she is her father's heiress. A person inheriting an estate other than the paternal one often assumes the arms of the former possessor, but should in strictness apply to the proper authorities. See *king at arms*, *herald* and *heralds*, *coll n*. Arms not paternal may be classed as follows: (a) *Arms of dominion*, or the national arms borne by the sovereign in which generally the bearings inherited by the prince as an individual have come to have a certain national character. (b) *Arms of community*, as of a corporation or diocese, or of the like. Arms assumed by a republic as by the United States or by one of the States, partake of the nature of both the preceding. (c) *Arms of pretension*, as specifically, those assumed by a sovereign in assertion of his claim to a realm not actually under his authority, like the fleurs-de-lis of France, which were borne by English sovereigns until 1801. (d) *Arms of succession*, denoting inheritance of an estate as mentioned above. (e) *Arms of assumption*, or *assumptive arms*, bearings assumed or granted in consequence of an exploit, as the three feathers with the motto *Ich dien* taken from the sham king John of Bohemia by Edward the Black Prince at the battle of Crécy (1346), and now borne by the Prince of Wales. (f) *Arms of alliance*, as where one spouse impales the arms of the other on his or her shield. (g) *Arms of office*, arms which are the prerogative or appendage of some public position. In all the above cases except (a) and (b) a private individual having a right to such arms changes them with the paternal arms, whether by quinqueting or otherwise. For the origin and history of arms, see *heraldry*. Abated arms. See *abate*.

— **Adoptive arms**. See *adoptive*. — **Allusive arms**, in *her*, a bearing or bearings having immediate reference to the wearer's name; thus, the arms of a person named Lamb or Herring would be termed *allusive*. If they included as a bearing a figure of the animal so named. In this way the name De Loupe may have been given to the first earls of Chester because of their bearing a wolf's head, or the name Arundel may be derived from swallows (French *hirondelles*) borne on the shield. The arms of Bolton are a crossbow bolt driven through a tin castle and I can find for their chief bearings a castle and a lion respectively. There are many such cases. Also called *allusive heraldry*, *canting heraldry*, *rebus* and *armes parlantes*. — **Arms-carrying Act**. See *Bill of Rights*, under *bill*. — **Arms of precision**, firearms fitted furnished with graded sights, accurately prepared bullets, and appliances calculated to enable them to act with precision and rapidity, and at much greater distances than ordinary weapons. The Armstrong gun and the Springfield and Martini Henry rifles are examples. — **Assize of arms**. See *assize*. — **Assumptive arms**. See above, 7(c), and *assumptive*. — **Coat of arms**. See *coat*. — **Places of arms**, in *fort*, parts of the covered way opposite the salient and reentrant angles of the counterescarp. — **Repeating arms**, arms that can be discharged a number of times without being reloaded. — **Rifled small arms**, rifles, muskets, carbines, pistols, or revolvers, the barrels of which are cut with spiral grooves or rifles. — **Small arms**, all weapons not requiring carriages as opposed to *artillery*, and including rifles, muskets, bayonet pistols, revolvers, submers, and swords, also, sporting weapons. — **Stand of arms**, a complete set of arms for one soldier, consisting of a musket, bayonet, cartridge box and belt, with or without a sword. — **To arms!** a warning equivalent to "arm! take to your arms, make ready for battle" (compare *alarm*). — **To bear arms**, to do military service, to serve as a soldier.

can edentate quadruped, of the order *Bruta* (or *Edentata*) and suborder *Lorata*, and of the extant families *Tatusidae*, *Dasypodidae*, and *Chlamyphoridae*, or of the extinct family *Glyptodontidae*, having a hard shell or carapace like a coat of mail, resulting from a peculiar ossification of the integument and the confluence of numerous small scutes. In the glyptodonts the carapace was entire and fixed, and even in some cases covered the belly as well as the back, but in all the living armadillos the shell is divided into an anterior, a posterior, and an entire or variously divided middle part. When the division of the middle part is complete, the animal can roll itself into a ball. The teeth are numerous, but vary in number and other characteristics with the several genera, in the genus *Protonotaria* they are a hundred in number. The puma is an armadillo of the family *Tatusidae*, the *Tatusia novae-angliae*, the only one of the group found as far north as the United States. There are other species. The *Chlamyphoridae* are the typical armadillos of the family *Dasypodidae*. The peludo is *Dasypus 9 lineatus*. The kabassou constitute the genus *Vermes*. The kabassou constitute the family *Chlamyphoridae*. They are the smallest and most peculiar forms, being less than a foot long while the kabassou is three feet long without the tail. All these animals are mild, timid, and inoffensive, subsisting on roots, leaves, and fruits sometimes on insects or flesh. They are able to dig into the ground with great rapidity, and escape from their enemies in this way as well as by rolling up in a ball. The flesh is considered good for food. 2. 2 Munitions of war, especially, the number and weight of all the guns which a ship of war carries. Within a comparatively short period remarkable changes have occurred in the size and weight of the armament of war vessels. In the United States, before the civil war, the usual armament for both forts and vessels consisted of 32 pounders. The war led to the construction and use of 15 inch smooth bore guns, weighing 50,000 pounds, and afterward of 20 inch guns, weighing 100,000 pounds. Rifling was introduced in 1859, and is now universally employed, reliance being placed upon the piercing power of elongated projectiles moving at a great velocity and fired from rifled guns. The United States battle ship 'Kearsarge' (1868) carries four 13-inch, four 8 inch fourteen 5 inch, and twenty six quick fire guns. In the British navy the 'Warrior', in 1861, was provided with 41 ton guns, but the weight of metal was successively increased up to the 80 ton guns of the 'Inflexible' (1876) and the 111 ton guns of the 'Serra Parilla' (1887). The 'Magnificent' (1894), the latest type, is armed with four 12 inch guns, twelve 6-inch guns, and twenty eight smaller quick fire guns. The more recent ships of other nations have similar armaments

=Syn *Pride, Arrogance, Presumption, Assumption, Haughtiness, Disdain, Loftiness, Superciliousness, Insolence, lordliness, self importance, imperiousness, swagger (See pride)* *Pride* and *disdain* are the only words in the list that may have a good meaning when applied to per

sons: *as, pride in one's country, disdain of a base suggestion. Pride primarily respects the temper of the mind, not being necessarily manifested or directed toward others, it is the general term for an unreasonable estimate of one's own superiority in any respect. As it comes into relation and action, it may receive other titles. Thus, arrogance is, at its simplest, *pride with contempt of others*, and is essentially the same as *disdain*. In action, *arrogance* is the assertion of exorbitant claims to rank, dignity, estimation, homage, power, etc. *Presumption* is often used for *arrogance*, but more properly expresses a self-conceited and self-important forwardness to run risks, take liberties, and crowd in where one does not deserve to be. *Presumption* helps itself to what it wants, while *arrogance* claims from others, and feeds its *pride* by seeing them yield. *Presumption* is less selfish than *arrogance*, but more conceited and headstrong. *Assumption* has added to its other meanings a bad sense, kindred to *presumption*, it means a disposition to do what does not belong to one to do, and sometimes to claim to be more than one is. *Haughtiness*, like *disdain* and *loftiness*, dwells upon the inferiority of others quite as much as upon its own elevation. It is equally applicable to spirit and to manner. *Disdain* is a mingling of lofty contempt with aversion, abhorrence, or indignation. *Superciliousness*, as befits its derivation, is chiefly applied to manner. It is a manifested haughtiness. *Insolence* is exhibited not only in manner, but in conduct and language, it is *pride or haughtiness*, shown in contemptuous or overbearing treatment of others, especially by words, from an equal or an inferior it is an outrageous kind of impertinence. See *impudence*, *egotism*, and *scorn*.*

When a boy could read, write and had mastered the elements of Latin grammar, he was considered ready to begin his studies in logic at the university. The instruction in the faculty of arts was sharply separated from the texts preliminary to the conferring of degrees. In the middle ages the subjects of the ordinary lectures were Priscian's grammar, the *Isagoge* of Porphyry, Aristotle's *Organon* and the *De Divisione* and three books of the *Topics* of Boetius while the extraordinary lectures related to rhetoric, ethics and a little geometry and astronomy. Frequent disputations constituted the only exercises for the scholars and the master disputed in public once a week. The degrees conferred at the recommendation of the faculty of arts were those of bachelor and master. In Paris the degree of licentiate was a distinct one intermediate between the others. The baccalaureate or determinate was not originally a degree. Upon the reform of the universities in the sixteenth century logic gave place to the humanities, and during the present century natural science has had a more considerable place in the instruction.—**Fine arts**, those arts which seek expression through beautiful modes, especially architecture, sculpture, painting and engraving.—**Hermetic art** See *hermetic*—**Master of Arts** See *master*—**Military art** See *military*, *a*—**Plastic art** or *arts*, sculpture including all subordinate or related arts by which objects are represented in the round or in relief. **Work of art**, anything in the formation or into the accomplishment of which art in any sense has entered, especially a production of any one of the fine arts but especially of one of the imitative members of the group as a statue or a painting

= *Syn.* 2 Aptitude, readiness, address, tact, adroitness, contrivance. 3 Shrewdness, subtlety, cunning, artifice, deceit, duplicity.—4. *Art, Science*. The essential difference between an art and a science is in aim. "Science and art may be said to be investigations of truth, but science inquires for the sake of knowledge, art for the sake of production (*karaktos*). Hence they differ somewhat in that with which they are concerned. An art directly and immediately concerns itself with a faculty. It fastens upon that and keeps it ever in its view as it teaches how that may be developed, trained and guided. A science, on the other hand, regards rather the product of a faculty, and, keeping its eye directly upon that, proceeds to unfold its nature and proper characteristics. (H. V. Day, Art of Discourse § 1) Incident to this difference is a difference in method, science being analytic and critical, while art is synthetic and constructive. In the matter which makes up the body of the two an art involves the means of discipline in the use of the knowledge which may have been furnished by a corresponding science. The same branch of knowledge may be regarded as either a science or an art. It may be viewed theoretically, as seeking, coordinating, arranging, and systematizing knowledge and by observation, comparison, abstraction, and generalization deducing laws, or as, with more or less reference to such preparatory work, framing rules which are the lessons of experience and are designed to facilitate work or give it superior excellence. The more complete the scientific basis of an art the more perfect the art. There is a secondary use of the word science by which it stands for an art that thus rests upon a science as in the following

The fundamental conception of the occupation of the architect embraces the two ideas of science and art. Architecture as an art is the work of the skilled hand, as a science, it is that of the informed and cultivated brain
